3.4.1 Get List of Company Payments ............................................................................ 301
3.4.2 Get List of Company Monthly Bills ....................................................................... 302
3.4.3 Create Company Payment .................................................. 302
3.4.4 Edit Company Payment .................................................... 302
3.4.5 Delete Company Payment .................................................. 302
3.5 External Networks API ......................................................... 302
3.5.1 Get List of vCloud External Networks .................................. 302
3.5.2 Get vCloud External Network Details .................................. 304
3.5.3 Get List of IP Addresses Assigned to vCloud External Network .................................. 306
3.6 Firewall Rules API ............................................................. 308
3.6.1 Get List of vCloud Firewall Rules ....................................... 308
3.6.2 Get Firewall Rule Details .................................................. 309
3.6.3 Create vCloud Firewall Rule .............................................. 310
3.6.4 Edit vCloud Firewall Rules .............................................. 311
3.6.5 Delete vCloud Firewall Rule .............................................. 312
3.7 Network Interfaces API ....................................................... 313
3.7.1 Get List of vCloud Network Interfaces ................................ 313
3.7.2 Get vCloud Network Interface Details ................................ 314
3.7.3 Create vCloud Network Interface ...................................... 316
3.7.4 Edit vCloud Network Interface ........................................ 316
3.7.5 Delete vCloud Network Interface ...................................... 317
3.8 Cross VDC Networks API .................................................... 317
3.8.1 Create Cross VDC Network .............................................. 317
3.8.2 Edit Cross VDC Network ................................................ 318
3.8.3 Delete Cross VDC Network .............................................. 318
3.9 Orchestration Models API ................................................... 319
3.9.1 Get List of Orchestration Models ...................................... 319
3.9.2 Get Orchestration Model Details ....................................... 324
3.9.3 Create Orchestration Model ............................................. 329
3.9.4 Edit Orchestration Model ................................................ 332
3.9.5 Deploy Orchestration Model ............................................. 335
3.9.6 Clone Orchestration Model .............................................. 337
3.9.7 Delete Orchestration Model ............................................. 338
3.10 Organizations API ............................................................ 338
3.10.1 Get List of Organizations .............................................. 338
3.10.2 Get Organization Details ............................................... 339
3.10.3 Create Organization ........................................................ 340
3.10.4 Delete Organization ........................................................ 341
3.11 Organization Networks API ................................................. 341
3.11.1 Get List of vCloud Organization Networks ............................ 341
3.11.2 Get vCloud Organization Network Details ........................... 343
3.11.3 Create vCloud Organization Network .................................. 345
3.11.4 Edit vCloud Organization Network ................................... 348
3.11.5 Delete vCloud Organization Network .................................. 350
3.12 Resource Pools API .......................................................... 350
3.12.1 Get List of Resource Pools .............................................. 350
3.12.2 Get Resource Pool Details .............................................. 351
3.12.4 Get List of Provider Resource Pools .................................. 354
3.12.5 Create Resource Pool ..................................................... 357
3.12.6 Edit Resource Pool ........................................................ 357
3.12.7 Delete Resource Pool ..................................................... 361
3.12.8 Create Resource Pool Data Store ..................................... 363
3.12.9 Edit Resource Pool Data Store ........................................ 364
3.12.10 Delete Resource Pool Data Store ..................................... 365
3.13 User Groups API ............................................................. 366
3.13.1 Get List of User Groups .................................................. 366
3.13.2 Get User Group Details .................................................. 368
3.13.3 Get List of Users Assigned to User Group ............................. 370
3.13.4 Get User Group Billing Reports ....................................... 374
3.13.5 Add User Group ............................................................ 375
3.13.6 Edit User Group ............................................................ 376
3.13.7 Delete User Group ........................................................ 377
3.14 Users API ................................................................. 377
3.14.1 Edit VMware Cloud Director Credentials ............................. 377
3.14.2 Add VCD User .............................................................. 377
3.14.3 Edit VCD User .............................................................. 379
3.14.4 Delete VCD User ........................................................... 380
3.15  vApps API ................................................................................................................. 380
3.15.1 Get List of vApps ................................................................................................. 380
3.15.2 Get List of vApp VSs ............................................................................................ 382
3.15.3 Get vApp Details ................................................................................................... 386
3.15.4 Get List of vApp VSs Start/Stop Order ............................................................... 388
3.15.5 Deploy vApp ....................................................................................................... 389
3.15.6 Compose vApp .................................................................................................... 390
3.15.7 Recompose vApp .................................................................................................. 392
3.15.8 Edit vApp .......................................................................................................... 395
3.15.9 Start vApp .......................................................................................................... 395
3.15.10 Stop vApp ......................................................................................................... 396
3.15.11 Start/Stop vApp VSs .......................................................................................... 396
3.15.12 Delete vApp ...................................................................................................... 397
3.15.13 Create vApp with Guest Customization and Recipes ...................................... 397
3.15.14 Change vApp Owner ........................................................................................ 399
3.15.15 Shutdown vApp ................................................................................................. 400
3.15.16 Suspend vApp .................................................................................................... 400
3.15.17 Unsuspend vApp ............................................................................................... 400
3.15.18 Reboot vApp ..................................................................................................... 401
3.16  vApp Networks API ............................................................................................... 401
3.16.1 Get List of vApp Networks .................................................................................. 401
3.16.2 Get vApp Network Details ................................................................................ 403

3.21.2 NSX-T Firewall Rules API ................................................................................. 508
3.21.3 NSX-T NAT API ............................................................................................... 513
1 Get Started

The Get Started guide contains information on how to configure the VCD and OnApp integration; provides details about the VCD implementation, supported functionality, settings, and the OnApp dashboard. For information on managing VCD entities in OnApp, refer to the Administration Guide. For the API requests for managing VCD entities, refer to the API Guide.

This guide is updated based on features, improvements, and fixes implemented for VCD within the latest OnApp version.

1.1 VMware Cloud Director OnApp Integration vs VMware Implementation

OnApp allows you to manage your VMware Cloud Director integration through a simple and intuitive web-based user interface. The OnApp UI facilitates management for all common entities of your VMware Cloud Director system, such as cloud resources, catalogues, organizations, and system users. In OnApp, you can find more services that go beyond the limits of VCD default features and allow you to extend the VMware Cloud Director native functionality to create solutions personalized to your exact requirements.

The following OnApp services are designed to provide advanced customization options for your VMware Cloud Director integration:

- **Service Add-ons** that allow you to provide your customers with additional services on top of your current offering.
- **Recipes** that represent a set of commands that are run on a VMware Cloud Director virtual server to trigger certain events during predefined stages.

When it comes to billing frameworks, OnApp provides a possibility to use the following options:

- **Company billing plans** (bucket) that you can create using various resource allocation models.
- **Integrated billing systems** that allow you to offer VMware Cloud Director functionality on top of OnApp to your customers using such modules as WHMCS.

As an integration-friendly platform, OnApp supports integration with other cloud providers, including AWS. You can manage your Amazon Elastic Compute Cloud (Amazon EC2) instances from your OnApp Control Panel using the AWS API.

In addition to the services mentioned above, you can use the OnApp intuitive user interface to run the following operations with VMware Cloud Director integration that are not available in VMware:

- **Create and Manage VCD Application Servers**
  Application Servers are regular virtual servers based on a default CentOS template with pre-installed additional software. This software allows you to install and get up and running various applications on a server, such as Joomla, Magento, WordPress, and others.

- **Create and Manage VCD Edge Servers**
  Edge Servers are designed to cache web content on the CDN distributed across different geographical locations. Starting with OnApp 5.4 version, the edge servers functionality is applicable for users with vCloud Director integration.

- **Create and Manage VCD Orchestration Models**
  vCloud Director orchestration models allow you to provide your customers with a ready environment that they can use to deploy virtual servers. You create and deploy orchestration models in your system and customers, in their turn, will receive a vCloud Director environment with configured resource pools, networks, and data stores.
Running your vCloud Director in OnApp ensures the availability of all default features available in VMware and provides a wide set of additional services that you can access and manage through a friendly and intuitive UI.

1.2 Configure VMware Cloud Director Integration

The VMware Cloud Director integration is included by default into the OnApp installer. Perform the following steps to install the Cloud Director:

- RabbitMQ and OnApp Control Panel Connection
- Import of VMware Cloud Director resources into OnApp

As initial import of VMware Cloud Director into OnApp might take a considerable amount of time, you may consider increasing the idle session timeout parameter in the VMware Cloud Director at Administration > General, to avoid the possible import failure.

You may also check the Versions Compatibility to see which OnApp and vCloud versions are compatible.

1.2.1 RabbitMQ And OnApp Control Panel Connection

OnApp VCD integration requires the use of RabbitMQ to keep VCD and OnApp synchronized. If you plan using the RabbitMQ server installed by OnApp by default, there is no need for additional configuration in OnApp Control Panel. Though, it is required that you edit the AMQP settings in VCD.

To specify RabbitMQ settings in VCD:

1. Go to your OnApp Control Panel server.
2. Open the /onapp/interface/config/on_app.yml file.
3. Find the RabbitMQ parameters:
   - rabbitmq_login
   - rabbitmq_password
   - rabbitmq_vhost
   - rabbitmq_host - make sure it is reachable by VMware Cloud Director
4. Edit your AMQP settings in VCD with the RabbitMQ details found at step 3:
   a. Navigate to the Administration tab of your System Organization, expand System Settings, and select Extensibility.
   b. Click Enable Notifications.
   c. Add the details from OnApp.
   d. Specify your VMware Cloud Director AMQP Exchange name that you should later use in the corresponding AMQP Exchange Name box while creating compute resources in OnApp.
• You can use the Shovel plugin to reliably and continually move messages from your own RabbitMQ instance to the OnApp's RabbitMQ instance. For more information refer to Using the Shovel plugin with RabbitMQ for VMware Cloud Director.

• Remember that rabbitmq_host must be reachable by VMware Cloud Director.

If you are running your own RabbitMQ server, it is required that you add the RabbitMQ details through the OnApp Control Panel.

To specify RabbitMQ settings in OnApp Control Panel:

If you want to use a separate RabbitMQ instance for VMware Cloud Director, specify the following VMware Cloud Director RabbitMQ parameters in the /onapp/configuration/rabbit_mq/vcloud/credentials.yml file:

• :host: - RabbitMQ server IP address
• :port: - RabbitMQ port
• :vhost: - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
• :user: - RabbitMQ login
• :password: - RabbitMQ password

If you want to use the same RabbitMQ instance both for VMware Cloud Director and OnApp engine:

1. Go to your Control Panel's Settings menu, and click the Configuration icon.

2. Click the System tab to change the following application settings:
   - RabbitMQ
     - Host - RabbitMQ server IP address
     - Virtual Host - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
     - Login - RabbitMQ login
     - Password - RabbitMQ password

You have to restart OnApp daemon after changing RabbitMQ credentials.

1.2.2 Import of VMware Cloud Director Resources into OnApp

Before you start

• Your VCD should be v10.1 or later.
• VCD public addresses should be configured properly.
• All VCD users should have a valid and unique email and First and Last name assigned inside of vCloud Director. Otherwise, they won't be imported.
• Currently fast-provisioned virtual datacenters are not supported for vApp provisioning.
• VCD users should be assigned one of the default or custom VMware Cloud Director roles.
• vApps that have “system” owner will be imported under "System Owner" in OnApp.
• Any system user will not be imported. OnApp will only import organization users.
• VSs currently cannot be connected to network during provisioning.
• VS passwords are not imported into OnApp.
• VMware Cloud Director system admins are not imported into OnApp and all management tasks are performed via the VMware Cloud Director web interface.
• VMware Cloud Director compute resource passwords are encrypted by default.

**Import**

To import your VMware Cloud Director resources into OnApp:

1. Log in to OnApp CP as an administrator.
2. Set Rabbit MQ credentials for the OnApp CP and your VMware Cloud Director.
3. Create a compute zone in which the VMware Cloud Director compute resource will reside.

To create a compute zone:

a. Go to your Control Panel's **Settings** menu and click the **Compute Zones** icon.
b. Press "+" or click the **Add New Compute Zone** button.
c. On the screen that follows:
   i. **Label** - give your compute zone a name
   ii. **Server type** - select a type for your zone. For VMware Cloud Director compute zones select the **Virtual Private Cloud** type.
   iii. **Location group** - select the location group to which this Compute zone will be assigned
   iv. **Failover timeout** - set the time period for which the iterations will run during the failover if the compute resource does not respond

d. Click the **Save** button.

4. Create a compute resource of a **vcloud** type and specify VMware Cloud Director global system admin credentials and API URL of your VMware Cloud Director.

When importing VCD resources you can choose whether you wish your users to be associated with one or several VMware Cloud Director instances. If you wish your users to have access to multiple VMware Cloud Director instances, you can set up several organizations from different VCD instances to be associated in OnApp with a single user group and have access to resources across multiple VCD instances.

- **single vCloud Director mode** - all resources are imported from the VCD instance. Each organization is imported as a separate user group which can be associated with one VCD instance.
- **multiple vCloud Director mode** - only system level entities are imported (provider VDCs, external networks, etc.). Organizations are imported but are empty, i.e. do not contain resources and users. After the initial import you can select which organization you wish to import and associate with a certain user group. Users imported in this mode can be configured to have access to multiple VCD instances.
To create a compute resource:

a. Go to your Control Panel **Settings** menu.

b. Click the **Compute Resources** icon.

c. Press + button or click the **Add New Compute Resource** button underneath the list of compute resources on the screen.

d. On the screen that appears:
   - **Label** - enter a compute resource name.
   - **Compute resource type** - choose a compute resource type. Select vcloud.
   - **Compute zone** - select the compute zone you added on Step 3.
   - **Operation mode** - select whether you wish to import the zone in the single or multiple VMware Cloud Director mode. If you select the multiple VMware Cloud Director, you need to later import the resources of an organization and its users.
   - **Login** - specify the VMware Cloud Director system admin login
   - **Password** - specify the VMware Cloud Director system admin password
   - **API URL** - set the VMware Cloud Director API URL - e.g. [https://example.com](https://example.com)
   - **AMQP Exchange Name** - specify your VMware Cloud Director AMQP exchange name (this can be taken in your VMware Cloud Director instance **Extensibility > Settings > Exchange**)

e. Click the **Save** button. The compute resource will be added to the system and the import will start automatically.

You can later switch from single VMware Cloud Director mode to the multiple VMware Cloud Director mode if required. In this case, the new organizations will no longer be synchronized from VCD to OnApp. It will be required to import each new organization.

You cannot switch from multiple to single VMware Cloud Director mode.

5. The import will start automatically. After the transaction is successfully completed, all your VMware Cloud Director resources will be shown in OnApp. You can view log output of transaction **Import vCloud to Control Panel** for more import details.

6. Import the users and resources of the required organization. This step is only applicable if you have selected the multiple VMware Cloud Director mode for your compute resource in step 4.

   a. Go to **Control Panel > Settings > Compute Resources > Label**.
   
   b. The page that loads shows the details of your VCD compute resource. Click **Tools** and select **Import Organization from vCloud**.
   
   c. Move the **Import** slider to the right next to the organization(s) you wish to import.
   
   d. Select a user group to which you wish to assign the organization in the **Assign to User Group** field. If you do not select a user group but enable the **Import** slider, a new user group will be created for this organization. If you select a user group that is already associated with one or several organizations, the users from the new
organization will be created in the already present organizations and the users from the already present organizations will be created in the new user group.

e. Click **Submit** to import the organizations.

After adding/deleting vCloud compute resource you need to restart OnApp service on the Control Panel for the correct statistics gathering and resources synchronization.

**To view the status of a current import or resync task:**

SSH into your OnApp Control Panel server and run the following command:

```
# tail -f /onapp/interface/log/production_vcloud.log
```

Please note if the import has never run before, then the production_vcloud.log file will not exist. Please re-run the command once the import has been started.

When importing a new vCloud instance you may run into some issues.

**Click here to see the most frequent errors and their resolutions.**

**Error: 404 Resource Not Found**

Initialize Fatal: ('404 Resource Not Found')

**Resolution**

Please ensure that the API URL you enter matches the "vCloud Director secure public REST API base URL" within VMware Cloud Director.

**Cause**

This error occurs if the URL entered is not correct.

**Error: 401 Unauthorized**

Initialize Fatal: ('401 Unauthorized')

**Resolution**

Please check the username and password that you have entered are correct.

**Cause**

This error occurs if there is an authentication issue when logging in to your vCloud instance.

**Error: 302 Found**

Initialize Fatal: ('302 Found')
Resolution
Please confirm you are using https:// and try the import again.

Cause
This error often occurs if you are trying to use http:// rather than https:// on your VCD API URL.

If you notice any other issues while running the import, please create a support ticket.

To use a command-line tool for monitoring a RabbitMQ server:
1. Run the special service:

   service onapp-mq-trace status / start / stop / restart / log

   Where:

   status - show the running service status
   start / stop - start or stop
   restart - stop (if stopped) and start again
   log - show log of tracer in tail -f mode (the service must be running)

2. /onapp/utilities/mq-tracer/trace.log file will be truncated every time during the service start. Before starting to use this service, set up connection credentials for the RabbitMQ server at /onapp/utilities/mq-tracer/config.yml (copy from /onapp/interface/config/on_app.yml):

   rabbitmq_login: guest
   rabbitmq_password: guest
   rabbitmq_vhost: "/
   rabbitmq_host: 127.0.0.1
   rabbitmq_port: 5662
   log_verbosity_level: 2

   Where:

   log_verbosity_level - can be 1 (minimal), 2 (most informative), or 3 (debug)
   1 - message body
   2 - body + properties
   3 - body + properties + delivery_info
You can find log files at /onapp/utilities/mq-tracer/:
trace.log - the trace log (the same information that the service onapp-mq-trace log gives)
util.log - error logs of the tool itself

The following step is no longer needed if you have the 4.2.0-127 (or higher) OnApp update installed.

3. If the RabbitMQ server runs on a separate host, enable the debug mode on it manually using the following command in that host:

```bash
rabbitmqctl trace_on
```

### 1.3 OnApp with VMware Cloud Director Installation Guide

Please note than OnApp 6.3 does not support any VMware Cloud Director version before 10.1.

If you wish to deploy only the VCD integration model, you only need to install the Control Panel server, configure Rabbit MQ, and import VMware Cloud Director:

- Install/Update Control Panel Server
- Configure RabbitMQ and OnApp Control Panel Connection
- Import of VMware Cloud Director Resources into OnApp

- As initial import of VMware Cloud Director into OnApp might take a considerable amount of time, you may consider increasing the idle session timeout parameter in the VMware Cloud Director at Administration > General, to avoid the possible import failure.
- It is recommended to have VMware Cloud Director and OnApp Control Panel in one network.
- If you already have RabbitMQ installed on another box or you already have VCD login and password, please run the installer with additional Rabbit MQ and VCD options.
1.3.1 Install/Update Control Panel Server

To install/update control panel server:
1. Update your server:

```
# yum update
```

2. Download OnApp YUM repository file:

```
# rpm -Uvh http://rpm.repo.onapp.com/repo/onapp-repo-6.4.noarch.rpm
```

3. Install OnApp Control Panel installer package:

```
#> yum install onapp-cp-install
```

4. Edit the `/onapp/onapp-cp.conf` file to set Control Panel custom values. Custom values must be set before the installer script runs.

```
# vi /onapp/onapp-cp.conf
```

5. Run the Control Panel installer:

```
#> /onapp/onapp-cp-install/onapp-cp-install.sh -i SNMP_TRAP_IPS
```

Ensure that the `SNMP_TRAP_IPS` should be the management IP of your CP server.

**VCD and Rabbit MQ options**
The installer will automatically install/upgrade RabbitMQ server on the CP’s box and configure it if no options are specified. Consider the options below for Rabbit MQ configuration if it is already installed on server separate from CP.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>--rbhost</td>
<td>IP address/FQDN where RabbitMQ Server runs. The RabbitMQ will be installed and configured on the current box if localhost/127.0.0.1 or box’s public IP address (enlisted in SNMP_TRAP_IPS) Default values is 127.0.0.1.</td>
</tr>
<tr>
<td>VCD_*</td>
<td>These options are useful if VMware Cloud Director/RabbitMQ is already installed and configured.</td>
</tr>
<tr>
<td>--VCDlogin</td>
<td>RabbitMQ/VMware Cloud Director user. Default value is ‘rbtVCD’.</td>
</tr>
<tr>
<td>--VCDpasswd</td>
<td>RabbitMQ/VMware Cloud Director user password. The random password is generated if isn’t specified.</td>
</tr>
<tr>
<td>--VCDvhost</td>
<td>RabbitMQ/VMware Cloud Director vhost. Default value is ‘/’</td>
</tr>
</tbody>
</table>
These options are used to configure RabbitMQ manager account. If local RabbitMQ server.

**--rbtlogin** `RBT_LOGIN`  
RabbitMQ manager login. The default value is 'rbtmgr'.

**--rbtpasswd** `RBT_PASSWD`  
RabbitMQ manager password. The random password is generated if isn't specified.

6. Install OnApp license to activate the Control Panel:
   Enter a valid license key via the Web UI (you'll be prompted to do so). Once you have entered a license it can take up to 15 minutes to activate.

7. Restart the OnApp service:
   ```
   #> service onapp restart
   ```

8. Once the installation of the Control Panel is complete, your default OnApp login will be **admin/changeme**. The password can be changed via the Control Panel's **Users** menu. You can now proceed to RabbitMQ and OnApp Control Panel connection.

- Installer output is redirected to `.onapp-cp-install.log`
- All installer critical errors are in `/var/log/messages`

If you are using the OnApp High Availability CP and VMware Cloud Director integration:
You need to perform the following steps to be able to use OVA and ISO functionality in your cloud.

1. Change the path to upload templates and media for using the shared directory:
   ```
   ...
   iso_path_on_cp: "/path_to_shared_directory"
   ova_path: "/path_to_shared_directory"
   ...
   
   You should specify the shared directory for ISO and OVA variables.
   ```

2. Unmanage `onapp-frontend-httpd-group-cluster` and `onapp-engine-group-cluster` resources and restart services to apply the new configuration:
   ```
   # crm resource unmanage onapp-frontend-httpd-group-cluster && crm resource unmanage onapp-engine-group-cluster
   ```

3. Restart the OnApp engine and httpd services on all nodes:
   ```
   # service onapp restart && service httpd restart
   ```

4. Ensure that the services have been restarted correctly.

5. Manage unmanaged resources from step 2:
   ```
   # crm resource manage onapp-frontend-httpd-group-cluster && crm resource manage onapp-engine-group-cluster
   ```

### 1.3.2 Configure RabbitMQ and OnApp Control Panel Connection
OnApp VCD integration requires the use of RabbitMQ to keep VCD and OnApp synchronized. If you plan using the RabbitMQ server installed by OnApp by default, there is no need for additional configuration in OnApp Control Panel. Though, it is required that you edit the AMQP settings in VCD.

**To specify RabbitMQ settings in VCD:**
1. Go to your OnApp Control Panel server.
2. Open the `/onapp/interface/config/on_app.yml` file.
3. Find the RabbitMQ parameters:
   - rabbitmq_login
   - rabbitmq_password
   - rabbitmq_vhost
   - rabbitmq_host - make sure it is reachable by VMware Cloud Director
4. Edit your AMQP settings in VCD with the RabbitMQ details found at step 3:
   a. Navigate to the Administration tab of your System Organization, expand System Settings, and select Extensibility.
   b. Click Enable Notifications.
   c. Add the details from OnApp.
   d. Specify your VMware Cloud Director AMQP Exchange name that you should later use in the corresponding AMQP Exchange Name box while creating compute resources in OnApp.

- You can use the Shovel plugin to reliably and continually move messages from your own RabbitMQ instance to the OnApp's RabbitMQ instance. For more information refer to Using the Shovel plugin with RabbitMQ for VMware Cloud Director.
- Remember that rabbitmq_host must be reachable by VMware Cloud Director.

If you are running your own RabbitMQ server, it is required that you add the RabbitMQ details through the OnApp Control Panel.

**To specify RabbitMQ settings in OnApp Control Panel:**
If you want to use a separate RabbitMQ instance for VMware Cloud Director, specify the following VMware Cloud Director RabbitMQ parameters in the `/onapp/configuration/rabbit_mq/vcloud/credentials.yml` file:

- :host: - RabbitMQ server IP address
- :port: - RabbitMQ port
- :vhost: - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
- :user: - RabbitMQ login
- :password: - RabbitMQ password

If you want to use the same RabbitMQ instance both for VMware Cloud Director and OnApp engine:
1. Go to your Control Panel's Settings menu, and click the Configuration icon.
2. Click the **System** tab to change the following application settings:
   **RabbitMQ**
   - **Host** - RabbitMQ server IP address
   - **Virtual Host** - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
   - **Login** - RabbitMQ login
   - **Password** - RabbitMQ password

You have to restart OnApp daemon after changing RabbitMQ credentials.

Remember that *rabbitmq_host* must be reachable by VMware Cloud Director.

---

**1.3.3 Import of VMware Cloud Director Resources into OnApp**

**Before you start**
- Your vCD should be v8.0 or later
- VCD public addresses should be configured properly
- All VCD users should have a valid email, or else they won’t be imported
- Currently, fast-provisioned virtual datacenters are not supported for vApp provisioning
- VCD users should be assigned one of the default or custom VMware Director roles.
- vApps that have “system” owner will be imported under “System Owner” in OnApp.
- VSs currently cannot be connected to the network during provisioning
- VS passwords are not imported into OnApp
- VMware Director system admins are not imported into OnApp and all management tasks are performed via the VMware Director web interface.
- VMware Director compute resource passwords are encrypted by default.

**Import**

To import your VMware Director resources into OnApp:
1. Log in to OnApp CP as an administrator.
2. Set Rabbit MQ credentials for the OnApp CP and your VMware Director.
3. Create a compute zone in which the VMware Director compute resource will reside.
   - To create a compute zone:
     a. Go to your Control Panel's **Settings** menu and click the **Compute Zones** icon.
b. Press "$+" or click the Add New Compute Zone button.

c. On the screen that follows:
   i. Label - give your compute zone a name
   ii. Server type - select a type for your zone. For VMware Director compute zones select the Virtual Private Cloud type.
   iii. Location group - select the location group to which this Compute zone will be assigned
   iv. Failover timeout - set the time period for which the iterations will run during the failover if the compute resource does not respond

d. Click the Save button.

4. Create a compute resource of a vcloud type and specify VMware Director global system admin credentials and API URL of your VMware Director.

When importing VCD resources you can choose whether you wish your users to be associated with one or several VMware Director instances. If you wish your users to have access to multiple VMware Director instances, you can set up several organizations from different VCD instances to be associated in OnApp with a single user group and have access to resources across multiple VCD instances.

- single vCloud Director mode - all resources are imported from the VCD instance. Each organization is imported as a separate user group which can be associated with one VCD instance.

- multiple vCloud director mode - only system level entities are imported (provider VDCs, external networks, etc.). Organizations are imported but are empty, i.e. do not contain resources and users. After the initial import, you can select which organization you wish to import and associate with a certain user group. Users imported in this mode can be configured to have access to multiple VCD instances.

To create a compute resource:

a. Go to your Control Panel Settings menu.

b. Click the Compute Resources icon.

c. Press + button or click the Add New Compute Resource button underneath the list of compute resources on the screen.

d. On the screen that appears:
   - Label - enter a compute resource name.
   - Compute resource type - choose a compute resource type. Select vcloud.
   - Compute zone - select the compute zone you added on Step 3.
   - Operation mode - select whether you wish to import the zone in the single or multiple VMware Director mode. If you select the multiple VMware Director, you need to later import the resources of an organization and its users.
   - Login - specify the VMware Director system admin login
   - Password - specify the VMware Director system admin password
   - API URL - set the VMware Director API URL - e.g. https://example.com
   - AMQP Exchange Name - specify your VMware Director AMQP exchange name (this can be taken in your VMware Director instance Extensibility > Settings > Exchange)
e. Click the **Save** button. The compute resource will be added to the system and the import will start automatically.

You can later switch from single VMware Director mode to the multiple VMware Director mode if required. In this case, the new organizations will no longer be synchronized from VCD to OnApp. It will be required to import each new organization.

You cannot switch from multiple to single VMware Director mode.

5. The import will start automatically. After the transaction is successfully completed, all your VMware Director resources will be shown in OnApp. You can view log output of transaction **Import vCloud to Control Panel** for more import details.

6. Import the users and resources of the required organization. This step is only applicable if you have selected the multiple VMware Director mode for your compute resource in step 4.

   a. Go to **Control Panel > Settings > Compute Resources > Label**.

   b. The page that loads shows the details of your VCD compute resource. Click **Tools** and select **Import Organization from vCloud**.

   c. Move the **Import** slider to the right next to the organization(s) you wish to import.

   d. Select a user group to which you wish to assign the organization in the **Assign to User Group** field. If you do not select a user group but enable the **Import** slider, a new user group will be created for this organization. If you select a user group that is already associated with one or several organizations, the users from the new organization will be created in the already present organizations and the users from the already present organizations will be created in the new user group.

   e. Click **Submit** to import the organizations.

**After adding/deleting vCloud compute resource you need to restart OnApp service on the Control Panel for the correct statistics gathering and resources synchronization.**

**Please note**

- At the moment, vCloud system admins are not imported into OnApp and all management tasks are performed via the VMware Cloud Director web interface.
- VS passwords are not imported into OnApp.
- vCloud compute resource passwords are encrypted by default.

**See also:**

- [Configure VMware Cloud Director Integration](#)
1.4 VMware Cloud Director Integration Details

OnApp gives you a possibility to import multiple VCDs into OnApp. The integration with VMware enables existing VMware Cloud Director installations to use the OnApp CP as their front-end UI. With the integration, OnApp provides UI options for VMware Cloud Director users (VS monitoring), and expands VMware Cloud Director capabilities with integrated buckets.

OnApp CP and the VMware Cloud Director are synchronized on a daily basis to update the data.

- Control Panel with VMware Cloud Director integration should have at least 3 onapp instances (vcloud L1, vcloud L2 and another one).
- OnApp supports both default and custom VCD roles. Default vCloud roles are mapped using the label, therefore, please do not change the labels of the default user roles in VMware Cloud Director. The custom role will not appear in the user creation wizard if the role does not exist in all organizations under a certain user group. Custom roles are not synchronized between the organizations in a user group, therefore, you will be required to add the same custom role in VCD for all organizations in a user group.

1.4.1 Versions Compatibility

Below you can find the compatibility matrix for VMware Cloud Director and OnApp versions:

<table>
<thead>
<tr>
<th>Versions</th>
<th>vCD 9.1</th>
<th>vCD 9.5</th>
<th>vCD 9.7</th>
<th>NSX-V</th>
<th>NSX-V</th>
<th>NSX-V + ability to work with network pools</th>
<th>NSX-V + ability to work with network pools</th>
<th>NSX-T, NSX-V + ability to work with network pools</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

1.4.2 Implementation

OnApp and VMware Cloud Director connection is supported with RabbitMQ. To integrate OnApp with the VMware Cloud Director, you must specify RabbitMQ credentials both on the
OnApp CP and the VMware Cloud Director (in beta version, RabbitMQ will be delivered with the OnApp RPMs. RabbitMQ will be synchronizing OnApp and the VMware Cloud Director: it will get the list of actions happen in the VCD and report it to the CP).

After that, add the VMware Cloud Director instance as an OnApp compute resource (vcloud type) and specify the VMware Cloud Director URL and VMware Cloud Director system admin credentials. After that, all the existing VMware Cloud Director resources will be shown in OnApp.

Starting with OnApp 5.5 version, vCloud administrator is imported into OnApp as "System owner" together with VSs and vApps, which belong to this user. "System owner" user can not be edited in OnApp, but cloud administrator has a possibility to reassign "System owner"'s VSs or vApps to other owners.

At the moment, importing a VMware Cloud Director into OnApp includes the following components:

- VMware Cloud Director instance (as an OnApp compute resource)
- vApps
- VSs
- Catalogues
- Organizations (added as OnApp user groups)
- Networks (organization vDC networks, external networks and vApp networks)
- Storage policies
- Users and their roles (except system administrators)

The import of other VMware Cloud Director components into OnApp is scheduled for the following releases.

When importing VCD resources you can choose whether you wish your users to be associated with one or several VMware Cloud Director instances. If you wish your users to have access to multiple VMware Cloud Director instances, you can set up several organizations from different VCD instances to be associated in OnApp with a single user groups and have access to resources across multiple VCD instances. There the following two variants of importing VCD into OnApp:

- **single vCloud Director mode** - all resources are imported from the VCD instance. Each organization is imported as a separate user group which can be associated with one VCD instance.

- **multiple vCloud director mode** - only system level entities are imported (provider VDCs, external networks, etc.). Organizations are imported but are empty, i.e. do not contain resources and users. After the initial import you can select which organization you wish to import and associate with a certain user group. Users imported in this mode can be configured to have access to multiple VCD instances.

If in VCD you delete a user from a user group with which several organizations from different VCDs are associated, the user will be removed but will be recreated after the synchronization. The reason is that the user exists in all organizations within one user group. If you delete...
such users in OnApp, they are removed from all organizations in the user group.

1.4.3 VMware Cloud Director Instance

1.4.3.1 Virtual Servers
Virtual servers, built on a guest operating system, can be used to install and run software compatible with that operation system.

VSs between VMware Cloud Director and vCenter are mapped using MoRef ID.

1.4.3.2 vApps
vApp consists of one or more virtual servers that communicate over a network and use resources and services in a deployed environment.

1.4.3.3 vApp Templates
A vApp template is a virtual server image that is loaded with an operating system, applications, and data. VApp templates are added to catalogs.

1.4.3.4 Catalogs
A catalog is a container for vApp templates and media files. You can view the list of catalogs at OnApp Control Panel > Cloud > Catalogs menu of your OnApp Cloud.

1.4.3.5 Edge Gateways
Edge Gateway is a virtual router for organization vDC (virtualDataCenter) networks. You can view the list of NSX-V and NSX-T edge gateways (together with firewall rules, NAT rules, and VPN service) at OnApp Control Panel > Cloud > Edge Gateways menu of your OnApp Cloud.

1.4.3.6 VMware Cloud Director Resource Pools
Resource pool is an allocation model which determines how and when the provider virtual data center compute and memory resources are committed to the organization virtual data center. There are three types of resource pools:

- Allocation Pool
- Pay-As-You-Go
- Reservation Pool
1.4.3.7 Orchestration Models

Orchestration models enable you to provide your customers with a ready environment which they can use to deploy virtual servers.

1.4.3.8 Organizations

VCD Organizations are associated with OnApp user groups. You can view individual organizations at Control Panel > Cloud > Organizations or the user groups the organizations are associated with at Control Panel > Cloud > Groups. If several organizations are associated with one user group, the users from each organization will be created in the other organizations in the group. In this case the users in the user group will have access to multiple VCD instances.

1.4.3.9 Buckets

A bucket is a set of limits and prices for the resources used by VMware Cloud Director organizations imported as user groups into OnApp.

1.4.4 Networks

External, organization and vApp network types, as well as network pools, are imported into OnApp as networks and network zones of the VPC type. Below are the details on how different VCD networks are imported:

**Network Pools**

Each network pool is imported into OnApp as two network zones:

- **Isolated network zone** - this zone contains isolated organization and vApp networks imported from VMware Cloud Director.
- **Routed network zone** - this zone contains routed organization and vApp networks imported from VMware Cloud Director.

**External Networks**

External networks are imported both as a network zone and as a network within that zone. Importing external networks as network zones enables administrators to configure billing for external network usage.

**Organization Networks**

Organization networks are imported into OnApp as Org networks and are associated with a network zone. Depending on the type of the organization network, it will be associated with a certain zone.

- **Routed organization networks** are associated with their network pool imported as a routed network zone.
• **Isolated organization networks** are associated with their network pool imported as an isolated network zone.

• **Direct organization networks** are associated with their external network imported as a network zone.

**vApp Networks**

vApp networks are imported into OnApp as networks and are associated with a network zone. Depending on the type of the vApp network, it will be associated with a certain zone.

• **Routed vApp networks** are associated with their network pool imported as a routed network zone.

• **Isolated vApp networks** are associated with their network pool imported as an isolated network zone.

• **Direct vApp networks** are associated with their parent organization network and are assigned to the network zone to which their parent networks are assigned. So depending on the parent network, they can be imported to Isolated, Routed, or External network zone.

1.4.5 **Storage Policies**

Provider storage policies are imported to OnApp as data store zones of the VPC type. Storage policies appear in the OnApp UI as data stores. You can select them during vApp creation. To view storage policies and the list of disks and VSs associated with them, go to the Admin > Settings > Data Stores menu.

1.4.6 **Users**

Users are imported with their existing roles. These roles are mapped using the label. OnApp imports the username and creates that user in OnApp. From that point forward, changes to the user should be made inside OnApp. OnApp will generate a random password for each imported user. The user will be emailed with the instructions to change this password to be able to log into OnApp. After the log in, user will be asked to confirm the VMware Cloud Director password.

Also, vCloud users can log in using SAML authentication. The process is the same as for usual OnApp users.

1.4.7 **Roles**

OnApp supports predefined and custom user roles imported from VMware Cloud Director. The custom roles are associated with the user group in which the organization that includes the role resides. Custom VCD roles in OnApp have the following appearance: **User Group Label-vCD Role Label**. You can view the organization with which the role is associated at Control Panel > Cloud > Roles > Label in the Assigned Organizations field.

If a custom user role exists in several organizations that are under different user groups in OnApp, for each of the user groups this role is created separately. In this case there will be several separate roles with the label of the user group they reside in and the name of the VCD custom role.

Custom roles are not synchronized between the organizations in a user group, therefore, you will be required to add the same custom role in VCD for all organizations in a user group. Additionally, the permissions list is not updated in OnApp for custom roles imported from VCD.
## 1.5 VMware Cloud Director Supported Functionality

Here is the list of the current VMware Cloud Director functions you can perform by means of the OnApp Control Panel:

<table>
<thead>
<tr>
<th>Functionality</th>
<th>Supported Actions</th>
<th>Version</th>
</tr>
</thead>
<tbody>
<tr>
<td>vApps</td>
<td>view</td>
<td>4.0 and up</td>

### 1.6 OnApp Dashboard

The OnApp dashboard is displayed after logging into the system. You can view resource usage statistics, activity log and summary of the entire cloud.
1.6.1 vCloud Director Statistics

You can choose the time period (24 hours, 7 or 30 days), for which the vCloud statistics will be shown. Resource statistics are represented in the form of bars and charts, which show the following:

<table>
<thead>
<tr>
<th>Resource</th>
<th>Used</th>
<th>Total</th>
<th>Chart</th>
</tr>
</thead>
<tbody>
<tr>
<td>vCloud CPU*</td>
<td>Points on the graph show daily peaks of used provider vDC CPU (in GHz)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>vCloud Storage*</td>
<td>Points on the graph show daily peaks of used vCloud storage (in GB)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*VMware Cloud Director charts are not shown on the dashboard if VMware Cloud Director has never been connected to the Control Panel.

To view additional VMware Cloud Director cloud statistics, click the vCloud icon by the silver dial. Be aware, that you should be logged in as vCloud administrator to view the statistics. You can view the following statistics:

- Memory - the amount of used/total memory (in GB)
- CPU - the amount of used/total CPU (in GHz)
- vDisks - the amount of vDisks and disk size (in GB), used by these vDisks
- IOPS - the amount of input and output requests

For more information on the OnApp dashboard, refer to the Dashboard guide.

Additionally, you can view the last time VCD statistics was gathered from VMware Cloud Director at Control Panel > Sysadmin.

There are two levels of VMware Cloud Director statistics gathering:

1. Level 1 - statuses of vApps and VSSs. This statistic is gathered every 60 seconds.
2. Level 2 - CPU statistics gathered every 180 seconds.
1.7 Configuration Settings

For more information on general OnApp system settings, refer to the Admin Guide.

Configuration settings include system settings related to RabbitMQ, VMware Cloud Director timeouts, and vDC maximum limits. To edit VCD-related configuration settings, refer to the following sections.

1.7.1 RabbitMQ Settings

To modify RabbitMQ settings for VMware Cloud Director:

1. Go to your Control Panel > Admin > Settings menu and click the Configuration icon.

2. Click the Infrastructure tab to change the following settings:

   If you change and save any settings, the Control Panel server will restart OnApp services.

   - RabbitMQ Host - RabbitMQ server IP address
   - RabbitMQ Port - RabbitMQ port
   - RabbitMQ Virtual Host - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
   - RabbitMQ Login - RabbitMQ login
   - RabbitMQ Password - RabbitMQ password

If you want to use a separate RabbitMQ instance for VMware Cloud Director, specify the following VMware Cloud Director RabbitMQ parameters in the /onapp/configuration/rabbit_mq/vcloud/credentials.yml file:

- :host: - RabbitMQ server IP address
- :port: - RabbitMQ port
- :vhost: - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
- :user: - RabbitMQ login
- :password: - RabbitMQ password

3. Click the Save Configuration button to apply settings.
1.7.2 VMware Cloud Director Timeouts

You can set custom timeouts for executing VCD-related operations. If the operation is not performed during the period of time you specify in timeouts, this operation will fail with the timeout error.

To set custom timeouts for VCD-related operations:

1. Go to your Control Panel > Admin > Settings menu and click the Configuration icon.

2. Click the vCloud tab and enter the timeout intervals in seconds for the following operations:
   - Default timeout - the default timeout for running VCD-related operations that are not listed below
   - Delete vApp template timeout - the amount of time for deleting a vApp template
   - Delete vApp timeout - the amount of time for deleting vApp
   - Delete media timeout - the amount of time for deleting media files
   - Instantiate vApp template timeout - the amount of time for provisioning vApp
   - Power-on timeout - the amount of time for starting up a powered-off virtual server
   - Power-off timeout - the amount of time for shutting down a powered-on virtual server
   - Suspend timeout - the amount of time for suspending a virtual server
   - Discard suspend timeout - the amount of time for unsuspending a virtual server
   - Reboot timeout - the amount of time for rebooting a virtual server
   - Undeploy timeout - the amount of time for undeploying a vApp
   - The undeployment is taking place for a vApp that includes no virtual servers but has assigned networks.
   - Process descriptor vApp template timeout - the amount of time for uploading a vApp template
   - HTTP request timeout - the amount of time for executing HTTP (API) requests
   - Recompose vApp timeout - the amount of time for recomposing vApp
   - Create edge gateway timeout - the amount of time for creating an edge gateway
   - Compose vApp template timeout - the amount of time for composing a vApp template
   - Create snapshot timeout - the amount of time for creating a VS snapshot
   - Create VDC timeout - the amount of time for creating a resource pool

3. Click the Save Configuration button to apply settings.

1.7.3 vCloud vDC limits

To set the maximum number of resources available in virtual data center:
1. Go to your Control Panel > Admin > Settings menu and click the Configuration icon.

2. Click the vCloud tab to set the following settings:
   - **Max CPU quota** - set the custom max CPU quota limit available. The default value is 1000GHz.
   - **Max memory quota** - set the custom max memory limit available. The default value is 1000GB.

3. Click the Save Configuration button to apply settings.

2.1.1 Manage VMware Cloud Director VSs

VMware Cloud Director virtual servers, built on a guest operating system, can be used to install and run software compatible with that operating system. Below you can view the list of the current functions you can perform with VMware Cloud Director virtual servers by means of OnApp Control Panel:

This document provides the information on how you can manage the virtual servers imported from your VMware Cloud Director.

This functionality is available for users with the following roles:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator

2.1.1.1 View Virtual Servers

1. Go to your Control Panel > Cloud > Virtual Servers menu to see an overview of all virtual servers in the cloud.

2. The page that loads will show the list of VSs together with their:
   - **operating system** - the OS on which the virtual server is based
   - **label** - the name of the virtual server. Click the label to see the VS details.
   - **IP addresses** - IP addresses assigned to the virtual server
   - **disk size** - disk size assigned to the virtual server in GB
   - **RAM** - RAM assigned to the virtual server in GB
   - **backups** - the number of snapshots and the space these snapshots occupy (available only for users with the vCloud Organization Administrator role)
   - **CPU(s)** - the number of CPU(s) included
   - **power status** - whether the VS is powered ON or OFF. Click the on/off buttons to change the status.
   - **actions** - click the Actions button next to the VS for the quick access to the list of VS actions:
     - **reboot** - click this action to reboot the virtual server
     - **shutdown** - click this action to shut down the virtual server

You can access the details page of a vApp to which the virtual server is assigned from the VS's Overview page. To view the details of the vApp with which the VS is associated, click the
Actions button on the VS Overview screen at your Control Panel > Cloud > Virtual Servers > VS label > Actions > vCloud Options > Go to vApp.

To be redirected to the VCD user interface from VS Tools menu: go to your Control Panel > Cloud > Virtual Servers > VS label > Actions > vCloud Options > Go to vCD UI.

You can install VMware tools for your VSs to customize the guest operation system. To install VMware tools, go to your Control Panel > Cloud > Virtual Servers > VS label > Actions > vCloud Options > Install VMware Tools. After that you can find VMware tools version at VS's Overview page. A VS must be powered on to install VMware Tools.

Ensure that Install VMware Tools permission is on before managing VMware tools. For more information about permissions, refer to the Permissions page.

2.1.1.1.1 Notes
The Notes section lists brief comments or reminders for a VS. You can add either Admin's or User's notes. The Admin's note will be available to cloud administrators with the Any action with admin note permission enabled. Click the Notes section of the page to add admin's or user's note.

2.1.1.1.2 Service Add-ons
If you have the service add-on functionality enabled and service add-on is assigned to the VS, you can view it at the VS overview page together with the following details:

- **Label** - the service add-on name (by clicking on it you can edit the service add-on)
- **Price** - the service add-on price, set for this service add-on in the Service Add-on Store
- **Type** - user or system
- **Status** - whether the service add-on is active or not
- **Delete icon** - you can unassign the Service Add-on from this Virtual Server by clicking the Delete icon

To assign more service add-ons to the VS, click the "+" button at the upper right corner of the section. You will be redirected to the VS Overview > VMware Cloud Director VS Service Add-ons section of the VS options.

2.1.1.2 Edit Virtual Server
You can edit the label, CPU, and RAM resources for all VCD virtual servers. You can allocate more CPU and RAM without rebooting a virtual server. When you hot add more RAM to virtual servers with Linux 64-bit or Windows 7 32-bit guest operating systems, the following conditions are applied:

- If the powered-on VS has less than 3 GB of RAM, you cannot hot add more than 3 GB of RAM.
- If the VS has 1 GB of RAM, you can add 2 GB.
- If the VS has 2 GB of RAM, you can add 1 GB.
- If the VS has 3444 MB of RAM, you can add 128 MB.
- If the powered-on VS has 3 GB of RAM, you cannot hot add any more RAM.

To edit a VCD virtual server:
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click a label of the server that you want to edit.
3. Click the **Actions** button, point to **Options**, and then click **Edit Virtual Server**.

4. You can edit the following virtual server settings:
   - **Label** - edit the label of the virtual server
   - **Virtual CPU hot add** - select this checkbox to add CPU resources without rebooting the VS
   - **Memory hot add** - select this checkbox to add RAM resources without rebooting the VS
   - **RAM** - change the amount of RAM allocated to the VS
   - **CPU Cores** - change the number of CPU cores allocated to the VS
   - **Cores per Socket** - select the number of CPU cores per socket

   If the **Virtual CPU hot add** and **Memory hot add** checkboxes are selected, you can add RAM and CPU without rebooting a VS. If only one checkbox is selected but you change both RAM and CPU, the VS needs to be rebooted.

5. Click the **Save** button.

6. If rebooting is required to apply the settings, click the **Continue** button.

---

### 2.1.1.3 Insert/Eject Media

This option allows you to attach an ISO file from the media library to the VS allowing you to utilize the contents of the ISO.

**To attach ISO to VS:**

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the appropriate virtual server.
3. Click the **Actions** button, point to **Options**, and select the **Insert Media** link.
4. Choose the ISO file from the drop-down list.
5. Click **Insert**.

**To remove ISO from VS:**

1. Go to your Control Panel's Virtual Servers menu.
2. Click the label of the appropriate virtual server.
3. Click the **Actions** button, point to **Options**, and select the **Eject Media** link.
4. Confirm by clicking the **Eject** button.

- Maximum one ISO can be inserted per VS at a time.
- Ensure that the Media permissions are on before enabling this option. For more information, refer to the Permissions page.
- Use only unique media file names. When you copy a media file from public catalogs, rename it (use a unique name) to avoid issues with media ejection.
- You cannot insert floppy disk image files since they are no longer supported by VMware Cloud Director.
2.1.1.4 Virtual Server Power Options

The power options available for VS depend on the current state of the virtual server. For example, a powered-on VS will have the Reboot, Suspend and Shut down options, while for a powered-off VS there will be the single option to Startup Virtual Server.

To manage your virtual server's power options:
1. Go to your Control Panel > **Cloud** > **Virtual Servers** menu.
2. Click the label of a required virtual server.
3. Click the Actions button, point to Power, and select the required power option:
   - **Startup Virtual Server** - power on a powered-off virtual server
   - **Reboot Virtual Server** - reboot the virtual server
   - **Shut down Virtual Server** - power off the virtual server. A pop-up window will appear where you can select whether the VS should be powered off gracefully (Gracefully shutdown) or forcefully (Power Off). If you select the former option and the system fails to shut down the VS gracefully in the time period indicated in the Timeout Before Shutting Down VSs (30-600 sec) parameter at Settings > Configuration > System, the VS will be shut down forcefully.
   - **Suspend** - suspend the virtual server
   - **Unsuspend** - unsuspend the virtual server

You can set custom timeouts that will be applied for executing the VS power actions and other VCD-related operations. For more information, refer to the **Configuration Settings** guide.

2.1.1.5 Virtual Server Console

This functionality is available for users with the vCloud Console Access Only role.

You can use the MKS virtual server console to manage your virtual servers in the command line mode. To use the virtual server console:
1. Go to your Control Panel > **Cloud** > **Virtual Servers** menu.
2. Click a label of a virtual server.
3. Click the **Console** button.
VMware Tools support shared folders and cut and paste operations between the guest operating system and the server from which you launch the VMware Cloud Director Web Console. VMware Cloud Director depends on VMware Tools to customize the guest OS. Using VMware Tools, you can move the pointer in and out of the virtual server console window. A virtual server must be powered on to install VMware Tools.

To add VMware tools:
1. Go to your Control Panel > **Cloud** > **Virtual Servers** menu.
2. Click the **Label** of appropriate Virtual Server.
3. Click the **Actions** button > **vCloud Options** > **Add VMware Tools**. You will be redirected to the VCD user interface, where you can install or upgrade VMware Tools.

2.1.1.6 Set SSH Keys

- This functionality is applicable to Linux-based VSs only.
- The virtual server will be rebooted after setting SSH keys.
- If a VS owner does not have any SSH keys, the system will only assign admin keys.
- When you have more than one SSH key, you will have access to a list of available SSH keys containing SSH keys of a VS owner and SSH keys of a user who proceeds with such changes.

1. Go to your Control Panel > **Cloud** > **Virtual Servers** menu.
2. Click the label of the necessary virtual server.
3. Click the **Actions** button, point to **Administration**, and select the **Set SSH keys** option to assign SSH keys of the **admin** and a VS owner to the VS.
4. If available, select the SSH keys from the list of VS owner keys and user keys from the dropbox.
5. Click the **Set SSH keys** button to confirm the action.

2.1.1.7 Resync Virtual Servers

If the background synchronizer does not work, you may resync a VS manually. It will resync the following:
- Disks
- NICs (network interfaces)
- CPU
- RAM

To be able to resync virtual servers, turn on the **Resync vCenter VS** permission for the vCloud Organization Administrator role:
1. Go to your Control Panel > **Admin** > **Roles** menu.
2. Click the Actions button next to the vCloud Organization Administrator role and select Edit.

3. In the Groups field, select Virtual Servers.

4. Next to the Resync vCenter VS permission, click the radio button in the Yes column.

   This option is enabled by default for the Administrator role.

To resync a virtual server:
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the imported virtual server.
3. Click the Actions button, point to Options, and select Resync Virtual Server.

2.1.1.8 Delete Virtual Servers
Shut down the virtual server before destroying it. To remove the virtual server from the cloud:
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. On the screen that appears, you'll see the list of all virtual servers in the cloud. Click the label of the virtual server you want to delete.
3. On the virtual server's screen, click the Actions button, point to Options, then select Delete Virtual Server.

2.1.2 Migrate VSs from VMware Cloud Director to KVM
OnApp enables you to migrate your VMware Cloud Director virtual servers from VMware to KVM virtualization. You can initiate the migration from your OnApp Control Panel, using the procedure described in this document. The migration workflow includes several actions that are required to get your virtual servers up and running on KVM.
This workflow describes the basic steps that are run to migrate a virtual server from VMware Cloud Director to KVM. You can enable some additional automation settings while initiating the migration in the wizard.

The Migration Workflow

1. You initiate the migration of a virtual server from your VMware Cloud Director to a KVM compute resource.
2. The source virtual server is stopped and then exported from VMware Cloud Director as a self-contained OVA package.
3. The OVA package is imported to the OVA List page in OnApp Control Panel.
4. The OVA package is converted to the KVM virtualization.
5. The virtual server is built from the OVA package.

Before you proceed to migrating your virtual server from VMware Cloud Director to KVM, please take a look at the following section.

2.1.2.1 Before You Begin

Before you proceed further, please note that:

- The migration from vCloud to KVM is available on clouds that run OnApp 5.10.
- You can migrate only virtual servers from your VMware Cloud Director instance to KVM.
- vCloud virtual servers with XFS or LVM partitions/file systems cannot be migrated to KVM.
- The Migrate any/own virtual server permission should be enabled for a user who wants to migrate a virtual server.
- The destination KVM compute, data store, backup server, and network zones should be available in a bucket of a user who runs the migration.
- You can migrate a virtual server to the KVM compute, data store, backup server, and network zones that have enough resources to handle the virtual server.
  - If there are not enough resources available in these zones, you cannot complete the wizard and initiate the migration.

If you experience any issues while migrating your virtual servers from VMware Cloud Director to KVM, see Troubleshooting.

2.1.2.2 Migrate Virtual Server to KVM

To migrate a virtual server from a VMware Cloud Director instance to a KVM compute resource, follow the next procedure:

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click a label of a virtual server that you want to migrate.
3. Click Actions, point to Options, and then click Migration to KVM.
4. Go through the following steps in the wizard to migrate the virtual server:
2.1.2.2.1 Step 1: Compute Resource
The first step enables you to select a KVM-based compute zone and resource to migrate your virtual server to.

- **Compute Zone** - select a KVM compute zone where you want to migrate the VS
- **Compute Resource** - select a destination KVM compute resources from the compute zone
- **Label** - edit a label of the VS if you want to keep the source VS after the migration
- **Hostname** - edit a hostname of the VS if you want to keep the source VS after the migration

Click **Next** to proceed to the following step.

2.1.2.2.2 Step 2: Disks
The second step allows you to configure the logic of the disks migration to data stores associated with the KVM compute zone. You can migrate all disks to one data store or select a separate data store for each disk.

- **Allow Disk to One Data Store** - switch the option on/off to enable or disable the migration of disks to one data store. Depending the selected option, one of the following boxes becomes available:
  - **All Disks to One Data Store** - select one data store to migrate all the disks to
  - **Select Data Store for Disk** - select a separate data store to migrate each disk to

Click **Next** to proceed to the following step.

2.1.2.2.3 Step 3: Networks
The third step enables you to apply the network configuration based on the networks available in the KVM compute zone. You assign each interface to a separate network from a destination network zone.

- **Network** - select a network for the interface or leave *Any*. If you select a specific network, you can also set the following network configurations.
- **IP net** - select an IP net that contains the IP address ranges of the network or leave *Any*
- **IP range** - select an IP range from an IP net that you selected in the previous step or leave *Any*
- **IP address** - select an IP address from an IP range that you selected in the previous step or leave *Any*

Click **Next** to proceed to the following step.

2.1.2.2.4 Step 4: Windows Licensing
If you migrate a Windows virtual server, the fourth step of the wizard enables you to edit the licensing settings. You can select one of the following licensing options:

- **None** - select the checkbox to migrate a virtual server without license changes
- **MAK** - select the checkbox to migrate a virtual server with the MAK license and edit the following settings:
  - **Distribution** - select the Windows OS distribution of the virtual server
  - **R2** - select the checkbox to use an updated release of the Windows OS distribution
  - **Architecture** - select the architecture of the OS (x86 or x64)
  - **Edition** - select the edition of the Windows OS
- **Your own license** - select the checkbox and paste your own licensing key

Click **Next** to proceed to the following step.
2.1.2.2.5  Step 5: Confirmation
The final step allows you to configure the automation settings and initiate the migration.

- **Start VS after migration** - enable the option to start the VS after the migration is finished. If you disable this option, you can start the VS via the **Power Options** after it is migrated.

- **Remove source VS after successful migration** - enable the option to delete the source VS after the migration is finished. If you disable this option, make sure that you edited **Label** and **Hostname** of the VS in the first step of the wizard.

Click **Submit** to initiate the migration.

After you submit the changes, several transactions are run to import your virtual server from VMware Cloud Director to KVM. When the virtual server is built, you can see a log of the transactions in the **Activity Log** section of the destination VS. The migration process could take up to 15 minutes, depending on the virtual server configuration and the migration settings. If you cannot complete the wizard, see **Troubleshooting**.

2.1.2.3  Troubleshooting
You may face the following issues while initiating the migration of your virtual server from VMware Cloud Director to KVM:

- **Not enough resources are available in a destination compute zone.**
  If there are not enough resources, such as RAM and CPU, select another compute zone or allocate more resources to the destination compute zone.

- **Not enough disk space is available in a destination data store zone.**
  If there is not enough disk space, select another data store zone or allocate more space to the destination data store zone.

- **Not enough IP addresses are available in a destination network zone.**
  If there are not enough IP addresses, select another network zone or allocate more IP addresses to the destination network zone.

2.1.3  Manage VMware Cloud Director VS Disks
Virtual server storage is provided by disks. A disk is a partition of a data store that is allocated to a specific virtual server. This section provides the information on all the actions supported for disks imported from your VMware Cloud Director.

This functionality is available for users with the following roles:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud Organization Administrator
2.1.3.1 View Disk Details

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the Label of an appropriate virtual server.
3. Go to the Storage tab and click Disks.
4. Click the Label of an appropriate disk. On the screen that appears, you will see the disk identifier, size in GB and bus sub type.

2.1.3.2 Create Disk

Adding a disk to a virtual server will require that VS to be rebooted. If a VS is running when you try to add a new disk to it, you’ll be asked to confirm the reboot. To add a disk to a virtual server:

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the Label of an appropriate virtual server.
3. Click the Storage tab > Disks.
4. Click the Create Disk button.
5. Fill in the details:
   - Data Store - select the data store to which the disk will be assigned
   - Size - enter the disk size
   - Bus Sub Type - select the sub type of ‘scsi controller’ to create the disk on. For more information, refer to VMware documentation.
6. Click the Add Disk button to finish.

When you add a new disk to a virtual server, it will automatically become available to that server.

2.1.3.3 Edit Disk

You can resize the disk or live migrate it to another data store by following the next steps:

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the Label of an appropriate virtual server.
3. Click the Storage tab > Disks.
4. Click the Actions icon next to the disk that you want to modify and click the Edit button.
5. In the pop-up window change the required parameters:
   - Label - enter a new label for the disk
   - Size - move the slider to select a new size for the disk in GB
   - Data Store - select a new data store for the disk
   - Hot migrate disk - turn the switcher to the right to run hot (live) migration of the disk to the destination data store
If you migrate the disk without the *Hot migrate disk* option enabled, the virtual server will be rebooted. You will be asked for confirmation to reboot the virtual server.

6. Click the **Save Disk** button.

- If fast provisioning is enabled for the disk **resource pool**, the disk cannot be resized.
- You cannot decrease the size of disk(s).
- You can only migrate disks to data stores in data store zones assigned to your **bucket**.
- You cannot migrate a disk to a data store with less capacity than the disk size.
- If required, you can change a block size which is used during the disk migration at Control Panel > **Settings > Configuration > System** by editing the **Block Size (MB)** parameter.

### 2.1.3.4 View Disk IOPS

1. Go to your Control Panel > **Cloud > Virtual Servers** menu.
2. Click the **Label** of an appropriate virtual server.
3. Click the **Storage** tab > **Disks**.
4. Click the **Actions** icon next to the required disk and click the **IOPS** button.
5. There are four charts on the screen that appears:
   - **Instant IOPS** - IOPS for the last hour
   - **Hourly IOPS** - IOPS for the last 24 hours
   - **Instant data written/read** - data written/read for the last 24 hours
   - **Hourly data written/read** - data written/read for the last hour

   To zoom into a time period, click and drag in a chart. Click the **Reset Zoom** button to zoom out again.

### 2.1.3.5 Delete Disk

1. Go to your Control Panel > **Cloud > Virtual Servers** menu.
2. Make sure your virtual server is powered off, then click its label to open its details screen.
3. Click the **Storage > Disks** tab.
4. Click the **Actions** icon next to the disk you want to delete and click the **Delete** button. You will be asked for confirmation.
The 'destroy disk' transaction is scheduled after you complete the preceding steps.

- Manage VMware Cloud Director VSs
- VMware Cloud Director VS Network Interfaces
- Virtual Server Statistics

### 2.1.4 View VMware Cloud Director VS Statistics

This section provides the info on how you can manage statistics of virtual servers imported from your VMware Cloud Director.

You can set the `vcloud_stats_batch_size` parameter in the `onapp.yml` file. This parameter defines the number of VSs in a batch during statistics collection.

To have all VMware Cloud Director statistics delivered to OnApp, you need to set the vCenter password(s):

1. Go to your Control Panel > Admin > Settings menu and click the Compute Resources icon.
2. Click the label of the Compute resource you want to set vCenter password(s) for.
3. On the screen that appears, click the Tools > vCenter passwords.
4. On the page that loads, fill in the vCenter password and Save. If valid vCenter password is entered and connection is successful, you will see green dot in Connection status under vCenter password field. If connection fails, the dot is red.

This functionality is available for users with the following roles:
- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator
- vCloud Console Access Only

### 2.1.4.1 Virtual Server CPU Usage Statistics
OnApp tracks CPU usage for virtual servers and generates charts that help analyze VS performance. The charts show the total CPU usage for all the cores of this particular VS for a specified time period.

The vertical axis shows the CPU usage percentage (CPU percentage is the core-independent quantity). The horizontal axis defines a time period.

To see CPU usage statistics:
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the virtual server you're interested in.
3. Click the Overview tab > CPU Usage.
4. On the screen that appears, the top chart shows CPU usage for the last 24 hours. The bottom chart shows usage for the last three months (if there is enough data). If there less data available, the chart will show utilization for the time available.
5. Tick the Show in My Timezone box to show bandwidth statistics according to your profile's timezone settings.
6. To zoom into a time period, click and drag in a chart. Click the Show All button to zoom out again.

To see what percentage of compute resource's CPU resource a VS takes, go to your Control Panel's Virtual Servers menu and click the label of the VS you're interested in. On the screen that appears, the CPU(s)/Shares parameter displays the amount of CPU resource given to this VS.

2.1.4.2 Virtual Server Disk IOPS Statistics

The system tracks IOPS (Input/Output Operations per Second) for virtual servers and generates charts that help analyze VS disk performance. The data presented in the chart are for the periods during which the statistics was gathered, typically 3 minutes. To see IOPS for a virtual server:
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the virtual server you're interested in.
3. Click the Storage > Disks tab.
4. Click the Actions button next to the required disk, and then choose IOPS.
5. Click the Statistics (chart) icon next to the disk you're interested in. There are four charts on the screen that appears:
   - IOPS for the last hour
   - IOPS for the last 24 hours
   - Data written/read for the last 24 hours
   - Data written/read for the last hour
6. To zoom into a time period, click and drag in a chart. Click the Show All button to zoom out again.

The OnApp API allows you to limit the Hourly IOPS and Hourly data by setting the limit=N parameter, where the N variable is the number of hours for which the charts will display the info.

2.1.4.3 Virtual Server Network Interface Statistics
OnApp tracks network usage for virtual servers and generates charts that help analyze network performance. To see network utilization statistics for a virtual server:

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the virtual server you’re interested in.
3. Click the Networking > Network Interfaces tab.
4. Click the Statistics (chart) icon next to the network you’re interested in.
5. On the screen that appears, the top chart shows bandwidth usage for the last 24 hours. The bottom chart shows usage for the last three months.
6. To zoom into a time period, click and drag in a chart. Click the Show all button to zoom out again.

2.1.5 VMware Cloud Director VS Network Interfaces

The Networking > Network Interfaces menu shows the virtual network interfaces allocated to this VS. Network interfaces join the physical network to the VS. When you create a VS a network interface is added automatically. This network interface will be assigned to the existing physical network using a spare IP (IPv4) and will be set primary by default.

OnApp supports IPv4 and IPv6. Since not every application supports IPv6, at least one IPv4 address must be allocated to a VS’s primary network interface.

- To run the VS, at least one network interface with an assigned IP address (or addresses) is required!
- To allocate another physical network, add a new network interface.
- The maximum number of networks that can be added to a virtual server is 10.

2.1.5.1 View Virtual Server Network Interfaces

This functionality is available for users with the following roles:
- vCloud Catalog Author
vCloud vApp Author
vCloud vApp User
vCloud Organization Administrator
vCloud Console Access Only

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the virtual server you are interested in.
3. Click the Networking tab and then click Network Interfaces.
4. On the page that follows you will see the following fields:
   - Interface - the optional label of the network interface
   - Network join - the name of the network and a compute resource or compute zone this network is joined to
   - Port Speed - the speed set for the interface
   - Adapter Type - the network adapter type appropriate for this VS
   - Primary Interface – indication whether the interface is primary or not.

Here you can also view Interface Usage, edit and delete network interface (using icon controls) and add a new network interface using the button at the bottom of the screen.

2.1.5.2 Create Virtual Server Network Interface

This functionality is available for users with the vCloud Organization Administrator role.

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the virtual server you are interested in.
3. Click the Networking tab and then click Network Interfaces.
4. Click the Add New Network Interface button at the bottom of the screen.
5. On the screen that appears, specify the following details:
   - Connected - select this checkbox to indicate that the network interface is connected to VS
   - Physical Network - select a physical network from the drop-down menu that lists network joins assigned to vApp
   - Adapter Type - select one of the following network adapter types for this VS:
     - Vlance
     - E1000
     - E1000E
     - VMXNET
     - VMXNET 2 (Enhanced)
- **VMXNET 3**
- **FLEXIBLE**

The VMXNET 3 adapter is selected by default as it is the most recent virtual network device from VMware that was designed for high performance. For more information on selecting network adapters, refer to VMware Documentation.

6. Click the Submit button.

The maximum number of networks that can be added to a virtual server is 10.

### 2.1.5.3 Edit Virtual Server Network Interface

This functionality is available for users with the vCloud Organization Administrator role.

1. Go to your Control Panel > **Cloud** > **Virtual Servers** menu.
2. Click the label of the virtual server you are interested in.
3. Click the **Networking** tab and then click **Network Interfaces**.
4. Click the **Edit** icon next to the interface you want to edit.
5. On the page that appears, you can change the following network interface details:
   - **Primary interface?** - select this checkbox to indicate that this interface is primary
   - **Connected** - select this checkbox to indicate that the network interface is connected to VS
   - **Physical network** - select a network join from the drop-down menu that lists network joins assigned to vApp

**If the Physical network drop-down list is blank**
The drop-down list may blank as vApp requires the organization network to be added to the vApp before it can be selected to be attached to a virtual server. To do that:

   i. Go to **Go to Control Panel > Cloud > vApps** menu.
   ii. Click the label of the required vApp.
   iii. On the vApp overview page click the + button above the vApp networks list.
   iv. On the screen that appears, select the organizational network with which the vApp network will be associated.
   v. Click **Create vApp Network** to finish the process. Adding a new vApp network will restart the vApp.

6. Click the Submit button.
2.1.5.4 Delete Virtual Server Network Interface

This functionality is available for users with the vCloud Organization Administrator role.

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the virtual server you are interested in.
3. Click the Networking tab and then click Network Interfaces.
4. Click the Delete interface button next to the interface you want to delete.
5. In the pop-up box, click OK to confirm the deletion.

See also:
- Manage VMware Cloud Director VSs
- Virtual Server Statistics
- VMware Cloud Director VS Snapshots
- Manage VMware Cloud Director VS Disks
- VMware Cloud Director VS Guest Customization

2.1.6 VMware Cloud Director VS Snapshots

Snapshots lock the file system disk and create a new disk with the changes made alongside. There can be only one snapshot per VS; when a new snapshot is created for the VS, the previous one is deleted. You can view, create and delete virtual server snapshots. This section provides information on how to view, create, build and restore VS snapshots.

This functionality is available for users with the following roles:
- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator

2.1.6.1 View VS Snapshots

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you want to back up.
3. Click the Actions button > point to Options > Snapshots.
4. On the screen that appears, you'll see the list of all VS snapshots together with their details:
   - Snapshot - the number of snapshot
• Name - timestamp, which shows when snapshot was taken
• Built - whether snapshot is built or not
• Note - text, added to the snapshot
• Actions icon - the actions you can perform with snapshot (restore, delete, add note).

2.1.6.2 Create VS Snapshots

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you want to back up.
3. Click the Actions button > point to Options > Snapshots.
4. Click the New Snapshot button.
5. Specify the following details:
   o Tick the Memory checkbox if you want to include a dump of the internal state of the virtual server in the snapshot. Memory snapshots take longer to create, but allow reversion to a running virtual server state as it was when the snapshot was taken.
   o Tick the Quiesce checkbox if you want to quieten the file system in the virtual server. Quiescing a file system is a process of bringing the on-disk data of a physical or virtual computer into a state suitable for backups. This process might include such operations as flushing dirty buffers from the operating system's in-memory cache to disk, or other higher-level application-specific tasks.
6. Click Create Snapshot button.

2.1.6.3 Restore VS Snapshot

You can restore the system to the state it was in when the snapshot was built. To restore the VS from a snapshot:
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you want to back up.
3. Click the Actions button > point to Options > Snapshots.
4. Click the Actions button next to the snapshot you want to use and select Restore.
2.1.6.4 Build VS Snapshot

If the VS snapshot failed to build due to some reason, you can attempt to create it again. To build a snapshot:

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you want to back up.
3. Click the Actions button > point to Options > Snapshot.
4. Click the Actions button next to the snapshot you want to use and select Build.

2.1.6.5 Delete VS Snapshot

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you want to back up.
3. Click the Actions button > point to Options > Snapshot.
4. Click the Actions button next to the snapshot you want to use and select Delete.

2.1.7 VMware Cloud Director VS Guest Customization

VS guest customization is a tool, which helps you to configure the operating system of a VS. You can customize the network settings of the guest operating system of a virtual server created from a vApp template. Guest customization can be managed at OnApp Control Panel. This section provides information on how you can view and edit VS guest customization details.

2.1.7.1 View Guest Customization

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you are interested in.
3. Click the Overview tab > Guest Customization.
4. The page that loads will show the following guest customization details:
   - **Enabled** - whether guest customization is enabled in VMware Cloud Director or not. The computer name and network settings configured for this VS are applied to its Guest OS when the VS is powered on. The following settings are only applied the first time the VS is powered on.
2.1.7.2 Edit Guest Customization

You can edit guest customization if you have VMware tools installed on a destination virtual server. To edit VS guest customization details:

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you are interested in.
3. Click the Overview tab > Guest Customization.
4. The page that loads will show the guest customization details. Click the Edit icon in the upper right corner and make the changes.
5. Click Update to save changes.

- Virtual Server Statistics

2.1.8 VMware Cloud Director VS Recipes

The recipe is the plugin mechanism used for adding new functionalities to the cloud. Each recipe is a set of instructions that triggers events at certain stages during the execution of certain services/event in the cloud. Essentially, recipes allow inputting code into virtual servers. This enables administrators to use recipes for configuring the server or report on it, thus providing advanced customization options in a standard environment.

Recipes allow admins to perform the following operations:
• Perform post script installation
• Use post provision installation scripts for third party applications, agents, etc.
• Disk reclaiming
• Update/modify virtual servers and compute zones with script injection
• Allow host to spin up custom virtual servers without requiring custom templates
• Download, run and report audit tools

The following requirements should be implemented before running recipes on vCloud virtual servers:
• **VMware Tools** must be installed. Also VMware compute resources, used by vCloud installation, need to be accessible over HTTPS from OnApp CP’s network.
• **Guest customization** must be enabled. Admin password must be set in the guest customization.

Currently, OnApp CP works only with Unix-compatible recipes for VMware Cloud Director VSs.

2.1.8.1 View Virtual Server Recipes

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you’re interested in.
3. Click the Overview tab, then choose Recipes.
4. The screen that follows shows details of all the recipes in the cloud:
   • The left pane shows the list of available recipes organized into recipe groups.
   • The right pane displays the list of events to which the recipes can be assigned to. Click the arrow button next to event to expand the list of recipes assigned to it.

2.1.8.2 Assign Recipe

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you’re interested in.
3. Click the Overview tab, then choose Recipes.
4. The screen that follows shows details of all the recipes in the cloud.
5. Click the arrow button in front of the required event to unfold it.
6. Select the required recipe in the left pane and hold it down with the left mouse button.
7. Drag the recipe up to the right pane and release the mouse button to drop the recipe and add it to the required event.

You can assign virtual server recipes to the following events:
### VS Provisioning
- **VS provisioning** - run the recipe during the virtual server provisioning
- **VS disk added** - run the recipe while adding a disk to the virtual server
- **IP address allocated for VS** - run the recipe when adding an IP address to the VS network interface
- **IP address revoked from VS** - run the recipe when removing an IP address from the VS network interface
- **VS network interface added** - run the recipe while adding a network interface to the virtual server
- **VS network interface removed** - run the recipe while deleting a network interface from the virtual server
- **VS disk resized** - run the recipe while resizing a virtual server disk
- **VS resize** - run the recipe while resizing the virtual server
- **VS start** - run the recipe while starting the virtual server
- **VS reboot** - run the recipe while rebooting the virtual server

### 2.1.8.3 Remove Recipe

1. Go to your Control Panel > **Cloud** > **Virtual Servers** menu.
2. Click the label of the server you're interested in.
3. Click the **Overview** tab, then choose **Recipes**.
4. The screen that follows shows details of all the recipes in the cloud.
5. Click the arrow button in front of the required event to view the list of recipes assigned to it.
6. Click the **Delete** button next to the recipe you want to remove.

- [Virtual Server Statistics](#)
- [VMware Cloud Director VS Snapshots](#)
- [Virtual Server Disks](#)
- [VMware Cloud Director VS Guest Customization](#)
- [VMware Cloud Director VS Recipe Custom Variables](#)

### 2.1.9 VMware Cloud Director VS Recipe Custom Variables

You can define custom variables for particular virtual servers. Each custom variable is a name-value set that can be used during the virtual server recipe implementation. Custom variables are set on a per server basis. You can create custom variables via the virtual server **Overview** menu.
2.1.9.1  View Virtual Server Recipe Custom Variables
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. You'll see a list of all virtual servers in your cloud. Click the name of a virtual server for which you want to view variables.
3. On the virtual server details screen, click the Overview tab, then choose Recipes Variables. The page that loads shows the list of recipe custom variables for this virtual server.

2.1.9.2  Create Virtual Server Recipe Custom Variables
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. You'll see a list of all virtual servers in your cloud. Click the name of a virtual server for which you want to create a variable.
3. On the virtual server details screen, click the Overview tab, then choose Recipes Variables. The page that loads shows the list of recipe custom variables for this virtual server.
4. On the screen that appears, click the "+" button.
5. Specify the recipe name and its value.
6. Move the Enabled slider to the right to allow use of this recipe.
7. Click Save.

2.1.9.3  Edit Virtual Server Recipe Custom Variables
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. You'll see a list of all virtual servers in your cloud. Click the name of a virtual server for which you want to edit a variable.
3. On the virtual server details screen, click the Overview tab, then choose Recipes Variables. The page that loads shows the list of recipe custom variables for this virtual server.
4. Click the Edit icon next to the required variable.
5. Edit the recipe name and its value.
6. Click Save.

2.1.9.4  Delete Virtual Server Recipe Custom Variables
1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. You'll see a list of all virtual servers in your cloud. Click the name of a virtual server for which you want to delete a variable.
3. On the virtual server details screen, click the Overview tab, then choose Recipes Variables. The page that loads shows the list of recipe custom variables for this virtual server.
4. Click the Delete icon next to the required variable. You will be asked for confirmation before the variable is deleted.
2.1.10 VMware Cloud Director VS Service Add-ons

Service Add-ons functionality allows you to offer to your customers additional services on top of your current IaaS Virtual Server offering.

Before managing service add-ons, ensure that:

1. VMware Cloud Director is added to OnApp UI.
2. RabbitMQ settings are set in config/rabbit_mq/vcloud/credentials.yml.
3. Login and password are set for vCenter (Control Panel should have access to vCenter directly) in Admin > Settings > Compute Resources > Compute resource's label > Actions > Resources Options > vCenter Passwords.
4. Guest customization is enabled on a VMware Cloud Director VS and Admin Password is set.

When you have the service add-on functionality enabled in your license and everything is properly configured, you can assign service add-on to your VMware Cloud Director VS.

You can monitor the total cost for all service add-ons inside the company. For this, go to your Control Panel’s > Admin > Groups > your User group’s label > Groups link.

- To manage user service add-ons for a VS, ensure that Manage Service Add-ons for all virtual servers and/or Manage Service Add-ons for own virtual servers permissions are enabled.
- To manage system service add-ons for a VS, ensure that Manage System Service Add-ons and/or Manage own System Service Add-ons permissions in the Virtual Servers section are enabled. For more information about permissions, refer to the Permissions page.

2.1.10.1 View VS service add-ons

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you're interested in.
3. Click the Overview tab, then choose Service Add-ons.
4. The screen that follows shows details of all the service add-ons assigned to the VS, if there are any:

- **Label** - the service add-on name (by clicking on it you can edit the service add-on)
- **Price** - the service add-on price, set for this service add-on in the Service Add-on Store
- **Status** - whether the service add-on is active or not
- **Actions icon** - you can unassign the Service Add-on from this Virtual Server by clicking the Delete icon.

Also, if any service add-on is already assigned to the VS, you can view it at the VS's details page.

2.1.10.2 Assign Service Add-on to the VS

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you're interested in.
3. Click the Overview tab, then choose Service Add-ons.
4. Click the + button at the upper right corner. You will get the list of service add-on groups (availability is configured in the bucket). The transaction to execute the On add event(s) will be scheduled for running.
5. Choose the necessary service add-on and click Assign.

Alternatively, if any service add-on is already assigned to the VS, you can assign another one at the VS's details page.

2.1.10.3 Unassign Service Add-on from the VS

1. Go to your Control Panel > Cloud > Virtual Servers menu.
2. Click the label of the server you're interested in.
3. Click the Overview tab, then choose Service Add-ons.
4. Click the Delete icon next to the service add-on you want to unassign. Confirm the deletion. The transaction to execute the On remove event(s) will be scheduled

Alternatively, you can unassign the service add-on at the VS's details page.

2.1.10.4 Generate Statistics for System Service Add-ons

You may generate the statistics for the system service add-ons usage for a specified period. To generate the statistics:

1. Go to your Control Panel > Admin > Users.
2. Click the Full Name of the cloud admin to get to the User Profile.
3. In the Billing Details section, click the System Service Add-ons Report button.
4. Select the time period from the drop-down menu and click the Apply button to generate the report.
5. On the page that appears you will see the report with the following details:
You can save your billing statistics to a file in a CSV format. To download a CSV file with billing statistics for a selected period of time, click the Save as CSV button. The download will start automatically after you click the button.

The CSV file includes the following information:

- **from** - the beginning of the specified time period for the statistics generation
- **till** - the end of the specified time period for the statistics generation
- **user_id** - the ID of the user
- **virtual_machine_id** - the ID of the VS the system service add-on in question is assigned to
- **service_addon_id** - the ID of the system service add-on
- **cpus** - the number of CPU cores used
- **memory** - RAM usage, GB
- **disk_size** - disk usage, GB

The generated reports will be stored at the System Service Add-ons Report page. However, if you have statistics archiving enabled for your cloud, the reports will be stored according to the period, specified for the archiving.

For Windows-based VSs, you may also generate an SPLA report on the system service add-ons usage. For more information, refer to the SPLA Report page.

### 2.2 VMware Cloud Director Application Servers

VMware Cloud Director application servers are managed similarly to the regular application server instances. For information on how to manage application servers, refer to the Application Servers page.

The application server creation process is similar to virtual server creation. The difference is that a specific default template is used automatically during application server creation. For more information, refer to the Application Server Billing section.
Before creating an Application server make sure that you specified at least two resolvers for the network on which this server will run. This can be done at Admin > Settings > Resolvers.

Before creating an Application server you need to configure notifications for your cloud. This can be done at Control Panel > Admin > Notifications > Configuration. For information on how to set up notifications for your VMware Cloud Director cloud, refer to Notifications.

Before creating an Application server you need to fill in the system_email parameter in the on_app.yml file.

Starting with OnApp 5.4 version, application servers functionality is applicable for users with VMware Cloud Director integration. Ensure that Create a new virtual server and Compute zones permissions are on before creating application server for vCloud.

To create a VMware Cloud Director Application Server:

1. Go to your Control Panel > Cloud > Application Servers menu.
2. On the screen that appears, press "+" button or click the Create Application Server button underneath the list of servers on the screen.
3. Complete the application server creation form through the following steps.

2.2.1 Step 1 of 4. Cloud Locations

The Cloud Locations step applies to those users who have compute zones assigned to location groups in their bucket.

If the user's bucket has several compute zones, some of which are assigned to location groups, whereas others are not - the cloud locations screen will not be available in the wizard. Also, if there is only one location, this step will be skipped. In this case the wizard will start with the Properties step.

Indicate your application server's cloud location:

- **Country** - choose the country, where the cloud is located, from the drop-down menu.
- **City** - specify the city, where the cloud is located, from the drop-down menu.

Click Next to proceed to the following steps of the wizard to specify the application server properties.

2.2.2 Step 2 of 4. Properties

Specify the following application server properties:

- **Label** - the label of the application server. The required parameter.
• **Hostname** - the hostname of the application server. The required parameter. The hostname should consist of letters [A-Z a-z], digits [0-9] and dash [-].

• **Domain** - specify the domain for this VS. The default value is *localdomain*. This parameter is not applicable to Windows virtual servers.

  For example:
  
  test.onapp.com - specify 'test' as hostname, 'onapp.com' - as domain. If you leave the domain field blank, the default value 'localdomain' will be used and you will get the following - test.onapp.com.localdomain.

Click **Next** to proceed to the following step of the wizard to specify the application server resources.

  Particular characters are not allowed in hostnames for Windows-based application servers:
  percent sign [%]
  double quotation marks ["]
  brackets [<,>]
  vertical bar [|]
  caret [^]
  ampersand [&]
  parentheses [(,)]

2.2.3 Step 3 of 4. Resources

At this step, you can set your application server's resources, such as disk size, network configuration and other.

**Compute Resources**

• **Compute Zone** - the compute zone to build the application server on.

• **User group** - select the organization from the drop-down menu

• **Vdc** - select vCloud resource pool from the drop-down menu

**Resources**

• **RAM** - set the amount of application server's RAM. The recommended RAM amount is at least 512 MB.

• **CPU Cores** - set the amount of application server's CPU cores. For KVM compute resources, this parameter sets CPU sockets by default, unless CPU topology is enabled.

**Primary Disk**

• **Data Store** - choose a data store for application server’s primary disk.

**Network Configuration**

• **Network** - choose a network from the drop-down box.
Click **Next** to proceed to the following step of the wizard that completes the application server creation process.

### 2.2.4 Step 4. Confirmation

At this step, configure the automation settings. This is the final step of the application server creation wizard.

- Move the **Build Virtual Server** slider to the right if you want the system to automatically build the application server. If you leave this box blank, you will have to build your server manually after it is created.

At the Confirmation step you can find the configuration summary of the application server, which will be created. You can view template's name, RAM size, number of networks, primary disk and swap disk size, number of cores.

After you set up all parameters, click the **Create Application Server** button to start the creation process.

### 2.3 VMware Cloud Director Edge Servers

Starting with OnApp 5.4 version, the edge servers functionality is applicable for users with VMware Cloud Director integration.

#### 2.3.1 Prerequisites

vCloud edge server cannot be created if OnApp has not been configured properly. Please make sure you have completed the following steps:

- Add vCloud resources such as Compute, Datastore and Network zones to a CDN-enabled location group
- Have at least one backup server running in the cloud
- Download *OnApp CDN Appliance* template with "vCloud" virtualization type under OnApp system administrator
- The CP's "data" folder should be mounted via NFS as "/data" at the Backup server
- An Edge Server should be provisioned under a user from vCloud organization
- In order to do that, following permissions must be assigned to the corresponding user role:
  - Show Compute Zones on VirtualServer creation
  - Build/rebuild user's own edge servers
  - Create a new edge server
- A public IPv4 address should be assigned to the CDN Edge Server
2.3.2 Create VMware Cloud Director Edge Server

1. Go to your Control Panel > CDN > Edge Servers menu.
2. On the screen that appears, click the Create Edge Server button or press the "+" button.
3. Fill in the edge server creation form step by step:

2.3.2.1 Step 1 of 4. Locations
The Cloud Locations step applies to those users who have compute zones assigned to location groups in their bucket.

If the user's bucket has several compute zones, some of which are assigned to location groups, whereas others are not - the cloud locations screen will not be available in the wizard. Also if there is only one location this step will be skipped. In this case the wizard will start with the Properties step.

Indicate your edge server's cloud location:
- **Country** - choose the country, where the cloud is located, from the drop-down menu.
- **City** - specify the city, where the cloud is located, from the drop-down menu.

Click Next to proceed to the following step of the wizard to specify the edge server properties.

2.3.2.2 Step 2 of 4. Properties
- Give your edge server a label. The label can consist of:

  - Lower- & upper-case letters [A-Za-z]
  - Digits [0-9]
  - Dash [-]
  - Underscore [ _ ]
  - Space character [ ]
  - At sign [@]
  - Brackets [ (){} ]
  - Slashes [/]
  - Caret[^]
  - Dollar sign [$]
  - Asterisk [*]
  - Comma [,]
  - Dot [

- Select an edge server type: HTTP or streaming

  A third party application - Wowza will be installed automatically when installing a streaming edge server and additional charges will apply. Please, contact your account manager for details.

- Move the Add to Marketplace slider to the right to submit this server to the OnApp CDN marketplace. If so, the minimum required disk size is 1 TB.

- Click Next.

Any servers you submit will be assessed before they are accepted into the marketplace. Criteria include geographic location, bandwidth and server specs.
If your cloud has sufficient resources, but the **Next** button is dimmed during server creation, the reason might be a browser issue.

2.3.2.3 Step 3 of 4. Resources

**Compute Resources**
- *Compute Zone* - the compute zone to build the edge server on.
- *User group* - select the organization from the drop-down menu
- *Vdc* - select vCloud resource pool from the drop-down menu

**Resources**
- *RAM* - set the amount of edge server's RAM. The recommended RAM amount is at least 512 MB.
- *CPU Cores* - set the amount of edge server's CPU cores. For KVM compute resources, this parameter sets CPU sockets by default, unless CPU topology is enabled.

**Primary Disk**
- *Data Store* - choose a data store for edge server's primary disk.

**Network Configuration**
- *Network* - choose a network from the drop-down box.

Click **Next** to proceed to the following step of the wizard that completes the edge server creation process.

2.3.2.4 Step 4. Confirmation

1. Move the **Build Edge Server Automatically** slider to the right if you want the system to automatically build the edge server. Otherwise, you will have to build your server manually after it is created.

2. Click **Create Edge Server**.

2.4 VMware Cloud Director vApps

A VMware Cloud Director vApp consists of one or more virtual servers that communicate over a network and use resources and services in a deployed environment.

In this chapter, you can find information on the following management options:
- **Create and Manage vApps**
- **Create and Manage vApp Templates**
- **Create and Manage vApp Networks**
- **Create and Manage Catalogs**
2.4.1 Create and Manage vApps

VMware Cloud Director vApp consists of one or more virtual servers that communicate over a network and use resources and services in a deployed environment. A vApp can contain multiple virtual servers. To view the list of the current vApp functions you can perform in OnApp Control Panel refer to the Supported Functionality section of this guide.

This document provides the information on how you can manage the vApps imported from your VMware Cloud Director.

This functionality is available for users with the following roles:
- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator

You can also access vApps shared with you by the administrator on the VMware Cloud Director side, depending on the access level granted to you.

2.4.1.1 View vApps

1. Go to your Control Panel > Cloud > vApps menu to see an overview of all vApps in the cloud.
2. The page that loads will show the list of vApps together with their details:
   - **Name** - the name of the vApp
   - **User** - the owner of the vApp. Click the user name to see the owner details. The owner of the vApp can be changed in VMware Cloud Director. These changes are synchronized with OnApp and can be seen in Control Panel > Cloud > vApps menu.
   - **Resource pool** - the label of the resource pool of this vApp
   - **Number of virtual servers** - the number of virtual servers within the vApp
   - **Number of networks** - the amount of vApp networks associated with this vApp
   - **Status** - the vApp status:
     - **Failed creation** - the vApp could not be created
     - **Unresolved** - the vApp is damaged and cannot be controlled by vCloud
     - **Resolved** - the vApp has been created but it does not contain VSs
     - **Suspended** - the vApp has been suspended; all virtual servers in the vApp are suspended
     - **Powered on** - all the VSs in the vApp are on
     - **Waiting for input** - the vApp is waiting for user input
     - **Unknown** - the vApp is in a state that is identified but is not known to the system
     - **Unrecognized** - the vApp is in a state that cannot be identified by the system
     - **Powered off** - all the VSs in the vApp are off
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **Inconsistent state** - the vApp is in an inconsistent state. This status appears when the vApp was edited from the vSphere associated with the VCD in which the vApp resides, therefore, the vSphere and VCD databases are not yet fully synchronized.

- **Mixed (number/number)** - the amount of virtual servers in the vApp that have different power statuses: the first *number* before the slash indicates the amount of powered-on VSs, the second *number* - total amount of VSs in the vApp.

- **Building** - after the vApp is created or imported, its status will be *Building*, until the creation/import process is finished. On the overview screen of a specific vApp, its status will be shown as *Pending*. The user cannot perform any actions to the pending vApp except for deleting it.
  
  - **Power** - the power status of the vApp. To change the status, click the on/off buttons and confirm.
  
  - **Actions** - click the *Actions* button to perform one of the following processes on the vApp:
    - Edit
    - Recompose
    - Add to Catalog
    - Stop/Start
    - Change owner
    - Delete
    - Spin up Network

### 2.4.1.1.1 vApp Details

Click the name of the vApp to view its details:

- **Name** - the name of the vApp
- **Description** - the description of the vApp
- **Status** - the status of the vApp. The vApp can have the following statuses:
  
  - **Failed creation** - the vApp could not be created
  - **Unresolved** - the vApp is damaged and cannot be controlled by vCloud
  - **Resolved** - the vApp has been created but it does not contain VSs
  - **Suspended** - the vApp has been suspended; all virtual servers in the vApp are suspended
  - **Powered on** - all the VSs in the vApp are on
  - **Waiting for input** - the vApp is waiting for user input
  - **Unknown** - the vApp is in a state that is identified but is not known to the system
  - **Unrecognized** - the vApp is in a state that cannot be identified by the system
  - **Powered off** - all the VSs in the vApp are off
  - **Inconsistent state** - the vApp is in an inconsistent state. This status appears when the vApp was edited from the vSphere associated with the VCD in which the vApp resides, therefore, the vSphere and VCD databases are not yet fully synchronized.
Mixed \( (\text{number}/\text{number}) \) - the amount of virtual servers in the vApp that have different power statuses: the first \( \text{number} \) before the slash indicates the amount of powered-on VSs, the second \( \text{number} \) - total amount of VSs in the vApp.

Pending - after the vApp is created or imported, its status will be Pending, until the creation/import process is finished. The user cannot perform any actions to the pending vApp except for deleting it.

- **Virtual servers** - the number of virtual servers within the vApp
- **Number of CPUs** - the number of CPUs used by the vApp
- **Virtual Servers** - the list of VSs associated with this vApp and their details. By pressing the “+” button you can recompose this vApp.
- **vApp Networks** - the list of vApp networks associated with this vApp and their details: label, status, network address. Click the **Actions** button to delete a vApp network. Removing the network will restart the vApp.
- **Activity log** - the list of log items associated with this vApp. Click the Ref number of a log item to view its details (data, action, status, initiator of transaction etc.)

Alternatively, you can access the details page of a particular vApp from the Overview page of a VS assigned to this vApp. To view the details of the vApp with which the VS is associated, click the **Tools** button on the VS Overview screen at **Dashboard > Cloud > Virtual Servers** > label of the VS you are interested in > **Tools** > **Go to vApp**.

### 2.4.1.2 Creating vApps

You can create a new vApp based on a vApp template stored in a catalog to which you have access. Alternatively, you can compose a new vApp using virtual servers from vApp templates, new virtual servers, or a combination of both.

You cannot add vApps when being logged in as a non VMware Cloud Director user.

### 2.4.1.2.1 Deploy New vApp

To configure guest customization and recipes during vApp creation you need to have the **Assign recipes to VS** and **Customize VS guest OS** permissions.

To create a new vApp:

1. Go to your Control Panel > **Cloud** > **vApps** menu to see an overview of all vApps in the cloud.
2. Click the **Deploy New vApp** button. If a new vApp template is created and added to catalog in VMware Cloud Director, it will be synchronized with OnApp. This vApp template will be added to the list of all vApp templates.
3. On the screen that appears, fill in the vApps creation form:
Step 1. vApp
- **Name** - specify the vApp label
- **Description** - enter the description for the vApp
- **Resource Pool** - select the resource pool for the new vApp
- **vApp Template** - select the vApp template
- Click **Next**.

Step 2. VS Resources
Click the template to set the resources for the VS that will be created from this template:
- **Label** - specify the name of VS
- **CPU Cores** - use the slider to set the number of CPU cores
- **Cores per socket** - set the number of cores per socket for the VS
- **RAM** - use the slider to set the RAM for the VS
- **Default Data Store** - choose the default data store from the drop-down list. If fast provisioning is not enabled for the previously selected resource pool, you can choose a different data store for the VS's disks.
- **Data Store for Hard Disk 1** - choose a data store from the drop-down list. This option appears only if the selected resource pool has fast provisioning disabled. If you do not select a data store, the disk will be built on the default data store.
- **Hard disk 1 Size** - set the size in GB
- **NIC 0 Connection** - select the network to which the NIC will be connected
- **Adapter Type for NIC 0** - select the type of the network adapter for NIC 0
- Click **Next** to proceed.

Step 3. Guest Customization
Click the template to configure guest customization for the VS that will be created from this template:

**General**
- **Host Name** - VS's computer name
- **Enabled** - whether guest customization is enabled for the VS or not. The computer name and network settings configured for this VS are applied to its Guest OS when the VS is booted. Guest customization should be enabled if you want to configure recipes for this VS.

If you do not tick the **Enabled** checkbox, the `PerformGuestCustomizationOnVirtualMachines` transaction will still run after you confirm vApp deployment: it will not perform guest customization on the VS, but only save the attributes selected at the Guest Customization step.
o  *Change SID* - this parameter is applicable for Windows VSs only and will run Sysprep to change Windows SID. On Windows NT, VCD uses Sidgen. Running sysprep is a prerequisite for completing domain join.

o  *Automatically Reboot* - enable this option if you want the VS to be automatically rebooted after guest customization settings are updated.

**Password Reset**

- Allow Local Admin Password - select whether the local admin password is allowed or not. This option should be enabled if you want to configure recipes for this VS.
- Auto Generate Password - select whether the admin password is generated automatically or not
- Admin password - enter the administrator password
- Automatically log on as Administrator - if this option is disabled, you will not be automatically logged in to the server's OS. This option applies only to Windows VSs.
- Number of Times to log on automatically - after the indicated time is exceeded and you were not able to log in, the VS will remain running and you will need to enter your credentials. This option applies only if the Automatically log on as Administrator option is enabled.
- Require Administrator to Change Password on First Login - if this option is disabled, the administrator will be able to log in to the virtual server's OS without changing their password

**Customization Script**

- Script - a script for guest customization
- Click Next to proceed.

**Step 4. Recipes or Service Add-ons**

If you want to configure recipes for the VS, you need to enable the Enable and Allow Local Admin Password options at the Guest Customization step. Click the template to configure recipes for the VS that will be created from this template:

**Recipes**

Use the drag and drop feature to assign recipes to the provisioning event.

a. Select the required recipe in the left pane and hold it down with the left mouse button.

b. Drag the recipe up to the right pane and release the mouse button to drop the recipe and add it to the required event.

c. If required, you can remove the assigned recipe by clicking the delete icon next to it.

**Custom Recipe Variables**

a. Specify the custom variable name and its value.

b. Move the Enabled slider to the right to allow use of this custom variable.

c. If required, you can remove a custom variable by clicking the delete icon next to it.
If mentioned below prerequisites are met, the Recipes step will be replaced with the Service Add-ons step.

**Service Add-ons**

**Prerequisites**

Ensure that the following requirements are met to be able to assign service add-on to vApp during its creation:

- *Replace recipes* permission is enabled
- Service add-on groups are available in your bucket
- The service add-on group within the bucket has the On Provisioning option enabled for some of those service add-ons. In case there are no available service add-ons, then this step of the wizard will be skipped.

At this step you need to indicate the service add-ons you want to assign to your vApp. This step is optional. You can add service add-ons later if required.

a. Click the service add-on group icon on the left to expand the list of service add-ons on the right. Every service add-on contains the following info:
   - Label
   - VS's types, with which this service add-on is compatible
   - Description of the service add-on
   - Price per hour
b. Select the service add-on.

b. Click **Next** to proceed to the next step of the wizard that completes the vApp creation process.

If you are deploying more than one template, take the above mentioned steps for every template.

**Step 5. Confirm**

Click the template to review the details of the VS that will be created from this template.

- *Disable guest customization after run* - move the slider to the right to schedule disabling of guest customization after the VS provisioning is finished.

The checkbox is available if you enabled guest customization at the third step of the wizard.

- *Boot VS* - move the slider to the right to boot the VS after deploying vApp.

If *Boot VS* is disabled and guest customization is enabled at the third step of the wizard, guest customization will be saved but not performed after the confirmation.
If `Boot VS` is disabled, guest customization is enabled at the third step of the wizard, and `Disable guest customization after run` is enabled, guest customization will be saved, disabled, and not performed.

4. Click **Deploy vApp** to finish the process.

### 2.4.1.2.2 Compose vApp

1. Go to your Control Panel > **Cloud** > **vApps** menu to see an overview of all vApps in the cloud.

2. Click the **Compose vApp** button.

3. On the screen that appears, fill in the form:

**Step 1. vApps and vApp Templates**

- **Blank vApp** - move the slider to the right if you want to create a blank vApp. Such a vApp will not contain any virtual servers. You need to fill in only the **Name**, **Description**, and **Resource Pool** for a blank vApp.

- **Name** - specify the vApp label

- **Description** - enter the description for the vApp

- **Resource Pool** - select the virtual data center

- **vApp Templates** - select one or several vApp templates from the drop-down list. All VSs built on those templates will be copied to your new vApp.

- **vApps** - select one or several vApps from the drop-down list. All VSs within selected vApps will be copied to your new vApp.

Click **Next**.

**Step 2. VS Resources**

Depending on the vApp Templates and vApps that you selected during the previous step, you can apply the following hardware customization to virtual servers:

- **Label** - edit the label of the virtual server

- **CPU Cores** - edit the number of CPU cores allocated to the virtual server

- **Cores per Socket** - edit the number of cores per socket allocated to the virtual server

- **RAM** - edit the amount of RAM allocated to the virtual server

- **Default Data Store** - select the default data store from the drop-down list. If Fast Provisioning is not enabled for the previously selected resource pool, you can select a different data store for the VS's disks.

- **Data Store for Hard disk 1** - select a data store for the first hard disk from the drop-down list. This option appears only if the selected resource pool has Fast Provisioning disabled. If you do not select a data store, the disk is built on the default data store.

- **Hard Disk 1 Size** - set the size for the first hard disk
Step 3. Guest Customization

Click the template to configure guest customization for the VS that will be created from this template:

General
- **Host Name** - VS's computer name
- **Enabled** - whether guest customization is enabled for the VS or not. The computer name and network settings configured for this VS are applied to its Guest OS when the VS is powered on. Guest customization should be enabled if you want to configure recipes for this VS.

If you do not tick the **Enabled** checkbox, the `PerformGuestCustomizationOnVirtualMachines` transaction will still run after you confirm vApp compose: it will not perform Guest Customization on the VS, but only save the attributes selected at the Guest Customization step.

- **Change SID** - this parameter is applicable for Windows VSs only and will run Sysprep to change Windows SID. On Windows NT, VCD uses Sidgen. Running sysprep is a prerequisite for completing domain join.
- **Automatically Reboot** - enable this option if you want the VS to be automatically rebooted after guest customization settings are updated.

Password Reset
- **Allow Local Admin Password** - select whether the local admin password is allowed or not. This option should be enabled if you want to configure recipes for this VS.
- **Auto Generate Password** - select whether the admin password is generated automatically or not
- **Admin password** - enter the administrator password
- **Automatically log on as Administrator** - if this option is disabled you will not be automatically logged into the server's OS. This option applies only to Windows VSs.
- **Number of Times to log on automatically** - after the indicated time is exceeded and you were not able to log in, the VS will remain running and you will need to enter your credentials. This option applies only if the **Automatically log on as Administrator** option is enabled.
- **Require Administrator to Change Password on First Login** - if this option is disabled the administrator will be able to log into the virtual server's OS without changing their password

Customization Script
- **Script** - a script for guest customization
- Click **Next** to proceed.
Step 4. Confirm

During the final step, you can overview the summary of virtual servers that the vApp will include and edit Automation Settings.

- **Disable guest customization after run** - move the slider to the right to schedule disabling of guest customization after the VS provisioning is finished.

  The checkbox is available if you enabled guest customization at the third step of the wizard.

- **Boot VS** - move the slider to the right to boot the VS after deploying vApp. Enabled by default.

  If **Boot VS** is disabled and guest customization is enabled at the third step of the wizard, guest customization will be saved but not performed after the confirmation.
  If **Boot VS** is disabled, guest customization is enabled at the third step of the wizard, and **Disable guest customization after run** is enabled, guest customization will be saved, disabled, and not performed.

- Click the **Compose vApp** button.

Recompose vApp

To configure guest customization and recipes during vApp creation you need to have the **Assign recipes to VS** and **Customize VS guest OS** permissions.

Unlike a **Compose vApp** option, which helps you to create a new vApp, the **Recompose vApp** option allows you to modify an existing vApp. After you recompose a vApp, new virtual servers will be added to it.

To recompose a vApp:

1. Go to **Control Panel > Cloud > vApps** menu.
2. Click the **Actions** button next to the vApp you want to change, then click **Recompose**.
3. Complete the two-step vApp recompose process:

   **Step 1. vApp Template**
   - **vApp Template** - select the vApp template
Step 2. VS Resources
Click the template to set the resources for the VS that will be created from this template:

- **Label** - the name of VS
- **CPU Cores** - use the slider to set the number of CPU cores
- **Cores per socket** - set the number of cores per socket for the VS
- **RAM** - use the slider to set the RAM for the VS
- **Default Data Store** - choose the default data store from the drop-down list. If fast provisioning is not enabled for the previously selected resource pool, you can choose a different data store for the VS’s disks.
- **Hard disk 1 Size** - set the size in GB
- **Data Store for Hard Disk 1** - choose a data store from the drop-down list. This option appears only if the selected resource pool has fast provisioning disabled. If you do not select a data store, the disk will be built on the default data store.
- **NIC 0 Connection** - the network to which the NIC will be connected
- **Adapter Type for NIC 0** - the type of the network adapter for NIC 0
- Click **Next** to proceed.

Step 3. Guest Customization
Click the template to configure guest customization for the VS that will be created from this template:

**General**

- **Host Name** - VS’s computer name
- **Enabled** - whether guest customization is enabled for the VS or not. The computer name and network settings configured for this VS are applied to its Guest OS when the VS is powered on. Guest customization should be enabled if you want to configure recipes for this VS.

If you do not tick the **Enabled** checkbox, the `PerformGuestCustomizationOnVirtualMachines` transaction will still run after you confirm vApp recompose: it will not perform Guest Customization on
the VS, but only save the attributes selected at the Guest Customization step.

- **Change SID** - this parameter is applicable for Windows VSs only and will run Sysprep to change Windows SID. On Windows NT, VCD uses Sidgen. Running sysprep is a prerequisite for completing domain join.

- **Automatically Reboot** - enable this option if you want the VS to be automatically rebooted after guest customization settings are updated.

**Password Reset**

- **Allow Local Admin Password** - select whether the local admin password is allowed or not. This option should be enabled if you want to configure recipes for this VS.

- **Auto Generate Password** - select whether the admin password is generated automatically or not

- **Admin password** - enter the administrator password

- **Automatically log on as Administrator** - if this option is disabled you will not be automatically logged into the server's OS. This option applies only to Windows VSs.

- **Number of Times to log on automatically** - after the indicated time is exceeded and you were not able to log in, the VS will remain running and you will need to enter your credentials. This option applies only if the **Automatically log on as Administrator** option is enabled.

- **Require Administrator to Change Password on First Login** - if this option is disabled the administrator will be able to log into the virtual server's OS without changing their password

**Customization Script**

- **Script** - a script for guest customization

- Click **Next** to proceed.

**Step 4. Recipes**

If you want to configure recipes for the VS, you need to enable the **Enable** and **Allow Local Admin Password** options at the Guest Customization step. Click the template to configure recipes for the VS that will be created from this template:

**Recipes**
Use the drag and drop feature to assign recipes to the provisioning event.

a. Select the required recipe in the left pane and hold it down with the left mouse button.
b. Drag the recipe up to the right pane and release the mouse button to drop the recipe and add it to the required event.
c. If required, you can remove the assigned recipe by clicking the delete icon next to it.

**Custom Recipe Variables**

a. Specify the custom variable name and its value.
b. Move the Enabled slider to the right to allow use of this custom variable.
c. If required, you can remove a custom variable by clicking the delete icon next to it.

If mentioned below prerequisites are met, the Recipes step will be replaced with the Service Add-ons step.

**Service Add-ons**

**Prerequisites**

Ensure that the following requirements are met to be able to assign service add-on to vApp during its creation:

- *Replace recipes* permission is enabled
- Service add-on groups are available in your bucket
- The service add-on group within the bucket has the On Provisioning option enabled for some of those service add-ons. In case there are no available service add-ons, then this step of the wizard will be skipped.

At this step you need to indicate the service add-ons you want to assign to your vApp. This step is optional. You can add service add-ons later if required.

a. Click the service add-on group icon on the left to expand the list of service add-ons on the right. Every service add-on contains the following info:
   - Label
   - VS's types, with which this service add-on is compatible
   - description of the service add-on
- Price per hour
  b. Select the service add-on.
  c. Click **Next** to proceed to the next step of the wizard that completes the vApp creation process.

**Step 5. Confirm**

- *Disable guest customization after run* - move the slider to the right to schedule disabling of guest customization after the VS provisioning is finished.

The checkbox is available if you enabled guest customization at the third step of the wizard.

- *Boot VS* - move the slider to the right to boot the VS after deploying vApp.

If *Boot VS* is disabled and guest customization is enabled at the third step of the wizard, guest customization will be saved but not performed after the confirmation. If *Boot VS* is disabled, guest customization is enabled at the third step of the wizard, and *Disable guest customization after run* is enabled, guest customization will be saved, disabled, and not performed.

Click the template to review the details of the VS that will be created from this template.

4. Click **Recompose vApp** to finish the process.

You can also access the vApp recompose wizard at **Control Panel > Cloud > vApps > Label** > icon in the **Virtual Servers** section.

**Add vApp to Catalog**

1. Go to **Control Panel > Cloud > vApps** menu.
2. Click the **Actions** button next to the vApp you want to add to catalog, then click **Add to Catalog**.
3. Fill in the following fields:
   o **Catalog** - choose the catalog from the drop-down menu
You can add vApp to a public catalog, which belongs to the same organization as vApp does.

- **Overwrite Catalog Item** - move the slider to the right to save this vApp as template instead of another vApp template. In the **Target vApp Template** field choose the appropriate vApp template, which will be replaced, from the drop-down menu.

If you assign a system service add-on to a VS associated with a vApp, and then convert this vApp to a vApp template, the aforementioned system service add-on will also be assigned to the newly created vApp template.

- **Label** - specify the name of the vApp. This option is missing if the Overwrite catalog item slider is enabled.
- **Description** - add the appropriate vApp description

4. Click **Add vApp to Catalog**.

After you add a vApp to catalog, you will be able to create a new vApp with the same configuration as the original one.

**Prerequisites**

Ensure that **Convert vApp** permission is on before adding vApp to catalog. For more information about permissions refer to the [VMware Cloud Director Permissions](#) section of this guide.

### Change vApp Owner

- You need to have the **Change vApp Owner** permission enabled to assign a vApp to the new owner.
- When you share your vApp with the organization or specific users and groups on the VCD side, the changes are automatically synchronized to Control Panel. Depending on the access level that you set via VCD, the corresponding users can access shared vApps on CP.
1. Go to **Control Panel** > **Cloud** > **vApps** > **Label**.
2. Click the **Tools** button and select **Change Owner**.
3. In the pop-up window select the new owner of the vApp from the drop-down list.
4. Click **Change owner**.

**Edit vApp**

1. Go to **Control Panel** > **Cloud** > **vApps** menu.
2. Click the **Actions** button next to the vApp you are interested in, then click **Edit**.
3. On the screen that appears, you can edit the name and description of the vApp.
4. Click **Save**.

**Start/Stop vApps**

1. To start a vApp in the cloud: Go to your **Control Panel** > **Cloud** > **vApps** > **Label**.
2. Click the **Tools** button and then click **Start**.

1. To shut down the vApp forcefully: Go to your **Control Panel** > **Cloud** > **vApps** > **Label**.
2. Click the **Tools** button and then click **Stop**.

1. To shut down the vApp gracefully: Go to your **Control Panel** > **Cloud** > **vApps** > **Label**.
2. Click the **Tools** button and then click **Shutdown**.

**Start/Stop vApp Virtual Servers**
You can schedule actions for starting and stopping virtual servers when the vApp is being started and stopped.

1. To preconfigure the start/stop actions for virtual servers that the vApp contains: Go to your Control Panel > Cloud > vApps > Label.
2. Click the Tools button and then click Starting and stopping VSs.
3. At the page that appears, you can set start/stop actions using the instructions from the table below.
4. Click the Submit button to apply settings.

<table>
<thead>
<tr>
<th>Virtual Server Label</th>
<th>Order</th>
<th>Start Action</th>
<th>Start Delay (seconds)</th>
<th>Stop Action</th>
<th>Stop Delay (seconds)</th>
</tr>
</thead>
</table>
| The list of vApp virtual servers to start and stop when the vApp is being started and stopped. | For vApps with multiple virtual servers, specify the order in which to start and stop VSs by typing numbers in the box. Virtual servers with lower numbers are started first and stopped last. You cannot specify negative numbers. Virtual servers with the same numbers are started and stopped at the same time. | Select an action to apply to virtual servers when you start the vApp:  
- **Power On** - select this option to power on virtual servers  
- **None** - select this option to run no start action on virtual servers | The delay in seconds after starting one virtual server and before starting the next virtual server. | Select an action to apply to virtual servers when you stop the vApp:  
- **Power Off** - select this option to power off virtual servers forcefully  
- **Shutdown** - select this option to shut down virtual servers gracefully | The delay in seconds to wait after stopping one virtual server and before stopping the next virtual server. |

**Suspend/Unsuspend vApp**
1. To suspend a vApp: Go to your Control Panel > Cloud > vApps menu to view all vApps and click the label of the required vApp.
2. Click the Tools button and select Suspend. The transaction to suspend all the VSs in the vApp will be scheduled.

There are two methods of unsuspend a vApp:
1. To shutdown all the vApp’s VSs and unsuspend the vApp: Go to your Control Panel > Cloud > vApps menu to view all vApps and click the label of the required vApp.
2. Click the Tools button and select Unsuspend. All the VSs in the vApp will shut down.

1. To start up all the vApp’s VSs and unsuspend the vApp: Go to your Control Panel > Cloud > vApps menu to view all vApps and click the label of the required vApp.
2. Click the Tools button and select Start. All the VSs in the vApp will scheduled to start.

**Reboot vApp**

1. To reboot a vApp and all the VSs in it: Go to your Control Panel > Cloud > vApps menu to view all vApps and click the label of the required vApp.
2. Click the Tools button and select Reboot. All the VSs in the vApp will scheduled to reboot.

**Delete vApps**

1. Go to your Control Panel > Cloud > vApps menu to view all vApps.
2. Click the Actions button next to the required vApp.
3. If the vApp is running, then choose the Stop action.
4. When the vApp is stopped, click Delete.

- See also: Manage VMware Cloud Director VSs
2.4.2 Create and Manage vApp Templates

A VMware Cloud Director vApp template is a virtual server image that is loaded with an operating system, applications, and data. These templates ensure that virtual servers are consistently configured across an entire organization.

vApp templates are added to vApp catalogs. You can add a vApp template to a vApp catalog via the OnApp Control Panel. It will be synchronized with VMware Cloud Director and a new vApp template will be added to the corresponding vApp catalog in VMware Cloud Director.

2.4.2.1 View vApp Template

This functionality is available for users with the following roles:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator
- vCloud Console Access Only

1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click a label of a vApp catalog.
3. Click a label of a vApp template.
4. On the screen that appears, you will see the following details about the vApp template:
   - Label - the label of the vApp template
   - Description - the description of the vApp template
   - Virtual Servers - the list of virtual servers that are built from the template
   - Activity Log - the activity log of the virtual servers

2.4.2.2 Create vApp Template

This functionality is available for users with the following roles:

- vCloud Catalog Author
- vCloud Organization Administrator

1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click a label of a vApp catalog.
3. On the screen that appears, click the "+" button or the **Upload vApp Template** button.
4. Specify the vApp template's label and click **Next**.
5. Specify the following parameters:
   - **File** - click the **Choose File** button to upload a template. Make sure to select all the files in the archive for the template.
   - **File URL** - indicate the route, from where the template will be uploaded.

   You can upload the following vApp template formats: OVF and OVA. Be aware that files inside OVA should not be archived, otherwise, the OVA upload will fail. Each template that you upload to CP should have a unique name.

6. Click **Submit**.

---

### 2.4.2.3 View vApp Templates Library

1. Go to your Control Panel > **Cloud** > **Catalogs** menu.
2. Click the label of a catalog you are interested in. You will see the catalog details (label, user group, amount of vApp templates and media files which this catalog contains).
3. Click the **vApp Templates** tab.
4. You will see the list of available vApp templates together with their details:
5. - **Label** - the name of vApp template
   - **Virtual Servers** - number of VSs that run on the vApp template
   - **Actions** - you can assign system service add-ons to the template and manage them and delete the template

---

### 2.4.2.4 Manage vApp Template System Service Add-ons

1. Go to your Control Panel > **Cloud** > **Catalogs** menu.
2. Click the label of a catalog you are interested in. You will see the catalog details (label, user group, amount of vApp templates and media files which this catalog contains).
3. Click the **vApp Templates** tab.
4. Next to the required template, click the **Actions** button and select the **Manage System Service Add-ons** option.
5. The screen that follows shows details of all the system service add-ons in the cloud:
The left pane shows the list of available system service add-ons organized into groups. Click the arrow button next to a group to expand the list of add-ons assigned to it.

The right pane displays the list of virtual servers assigned to this vApp, which the system service add-ons can be assigned to.

**Assign system service add-on to vApp template**

Use drag and drop feature to assign system service add-on to a vApp template:

1. Click the arrow button in front of the required system service add-on group to unfold it.
2. Select the required system service add-on in the left pane and hold it down with the left mouse button.
3. Drag the system service add-on up to the right pane and release the mouse button to drop and add the add-on to the required virtual server assigned to this vApp.

**Unassign system service add-on from vApp template**

To unassign a system service add-on:

1. Click the arrow button in front of the required virtual server to view the list of system service add-on assigned to it.
2. Click the **Delete** button next to the system service add-on you want to unassign.

### 2.4.2.5 Delete vApp Template

This functionality is available for users with the vCloud Organization Administrator role.

1. Go to your Control Panel > **Cloud** > **Catalogs** menu.
2. Click a label of a vApp catalog.
3. On the screen that appears, you will see the list of vApp templates added to this vApp catalog.
4. Click the **Actions** button next to the template you want to delete and click **Delete**.
5. Confirm the deletion.

**See also:**
- [Create and Manage Catalogs](#)
2.4.3 Create and Manage vApp Networks

The following network types are imported into OnApp:

- **organization vDC networks** (this network allows virtual servers in the organization vDC to communicate with each other and to access other networks)
- **external networks** (this network provides the interface to the Internet for virtual servers connected to external organization vDC networks)
- **vApp networks** (this network controls how the virtual servers in a vApp connect to each other and to organization vDC networks)

You can view the list of imported vApp networks at OnApp Cloud Control Panel. Also you can add a vApp network in VMware Cloud Director using OnApp Control Panel.

This functionality is available for users with the following roles:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator

2.4.3.1 View vApp Networks

1. Go to your Control Panel > Admin > Settings menu.
2. Click the **Networks** button and select the **vApp** tab.
3. The screen that appears shows the list of your imported vApp networks and their details.
   - **Network label** - the label of the network
   - **Network identifier** - the identifier of the network
   - **VLAN** - VLAN number
   - **Actions** - click the Actions button to edit or delete the vApp network.

You can also click a network’s label to see the list of IPs assigned to that network.

2.4.3.2 Create vApp Network

Ensure that the **vApp Networks** permissions are on before creating a vApp network. For more information about permissions, refer to the [VMware Cloud Director Permissions](#) section of this guide.

1. Go to your Control Panel > **Cloud** > **vApps** menu.
2. Click the label of the required vApp.
3. On the vApp overview page click the + button above the vApp networks list.

4. On the screen that appears, select the organizational network with which the vApp network will be associated.

5. Click **Create vApp Network** to finish the process. Adding a new vApp network will restart the vApp.

### 2.4.3.3 Delete vApp Network

1. Go to your **Control Panel > Cloud > vApps** menu.

2. Click the label of the required vApp.

3. Click the **Actions** button next to the required network in the vApp networks list and select **Delete**. Deleting a network will restart the vApp.

- [Manage VMware Cloud Director VSs](#)

### 2.4.4 Create and Manage Catalogs

A VMware Cloud Director catalog is a container for vApp templates and media files. Users can access vApp templates and media files that they own or that are shared with them.

In VMware Cloud Director there is a possibility to make a catalog public. When catalog is public all organizations will see the catalog to deploy vApps from. Administrators can access a published catalog and copy its vApp templates to a catalog in their organization. They can then share the organization catalog with other members of their organization so that they can use the vApp templates and media files.

OnApp provides an ability to import vApp catalogs from VMware Cloud Director and use them for vApp creation.

You can create, edit or delete a vApp catalog via the OnApp Control Panel. The action will be synchronized with VMware Cloud Director and a new catalog will be created or deleted in VMware Cloud Director. Also you can [save a vApp to a catalog](#) as a vApp template.

The catalogs functionality is available for users with the following roles:
- vCloud Catalog Author
- vCloud Organization Administrator

### 2.4.4.1 View Catalogs

1. Go to your **Control Panel > Cloud > Catalogs** menu.

2. On the screen that appears, you will see the catalogs imported from the VMware Cloud Director and their details:
   - **Label** - the name of the catalog
   - **User Group** - the user group to which the catalog is assigned
   - **Resource Pool** - the resource pool that is used by the catalog
   - **Organization** - the organization to which the catalog is assigned
   - **vApp Templates** - the number of vApp templates that the catalog includes
• **Media** - the number of media files that the catalog includes

• **Published** - whether this catalog is published or not. The ✅ icon appears next to catalogs that are published, i.e. shared between all organizations. An ❌ icon appears next to catalogs that are shared only between certain organizations or users.

• **Actions** - click the button if you want to **Edit** or **Delete** the catalog

Click the catalog label to view the list of assigned templates and media files.

### 2.4.4.2 Create Catalog
1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click the **New Catalog** button.
3. Set the following parameters:
   - **Label** - specify the label of a new catalog
   - **Description** - add description of the catalog
   - **Organization** - select the organization this catalog will be added to
   - **Resource Pool** - choose the resource pool this catalog will be assigned to
   - **Data Store** - choose the data store this catalog will be assigned to
4. Click the **Submit** button.

### 2.4.4.3 Edit Catalog
1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click the **Actions** button next to the catalog you want to edit and click **Edit**.
3. Edit the following parameters:
   - **Label** - the label of a catalog
   - **Description** - add description of the catalog
4. Click the **Submit** button.

### 2.4.4.4 Delete Catalog
1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click the **Actions** button next to the catalog you want to delete and click **Delete**.
3. Confirm the deletion.

### 2.4.4.5 View Media Library

This functionality is available for users with the following roles:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
Media library is a part of a catalog, which contains different file types for their further usage.

- Currently, only ISO files can be uploaded to Media library.
- Ensure that the Media permissions are on before enabling this option. For more information, refer to the Permissions section.

To view the Media library:
1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click the label of a catalog you are interested in. You will see the catalog details (label, user group, amount of vApp templates and media files which this catalog contains).
3. Click the Media tab.
4. You will see the list of available media files together with their details:
   - Label - the name of media file
   - Status - the status of media file
   - Image Type - the type of media file (ISO)
   - Resource Pool - the label of resource pool where media file is stored
   - Size - the size of media file
   - Created on - the date of media file creation
   - Actions - you can either edit media file (change label) or delete file

You can attach an ISO file from the media library to the VS. For details refer to the Manage VMware Cloud Director VSs section of this guide.

2.4.4.6 Add File to Media Library

1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click the label of a catalog you are interested in. You will see the catalog details (label, user group, amount of vApp templates and media files which this catalog contains).
3. Click the Media tab. You will see the list of available media files together with their details.
4. Click the "+" button in the upper right corner of the section or the Upload Media button.
5. Enter a name for the file you wish to upload and click Next.
6. Click the Choose File button and indicate the path from where the file will be uploaded. You can add only one file at a time.
7. Click the Upload button to add the file or click Cancel to select another file.
8. Click Submit to finish the process.
2.4.4.7 View vApp Templates Library

1. Go to your Control Panel > Cloud > Catalogs menu.
2. Click the label of a catalog you are interested in. You will see the catalog details (label, user group, amount of vApp templates and media files which this catalog contains).
3. Click the vApp Templates tab.
4. You will see the list of available vApp templates together with their details:
5. 
   - **Label** - the name of vApp template
   - **Virtual Servers** - number of VSs that run on the vApp template
   - **Actions** - you can manage system service add-ons of the template, or delete the template

- Create and Manage vApps
- Create and Manage Orchestration Models
- Manage VMware Cloud Director VSs

2.5 Organizations and Users

In this chapter, you can find information on how to manage VMware Cloud Director Organizations and Users:
- Set up New Customers
- Create and Manage Users
- Create and Manage Organizations
- VMware Cloud Director Credentials
- VMware Cloud Director Roles

2.5.1 Set up New Customers

This page provides an overview of how to onboard a new customer for VMware VMware Cloud Director, using OnApp. The procedure consists of the following steps:

2.5.1.1 1. Create an Organization
The first step is to create a new organization in OnApp. During the creation process you need to add the organization to an existing user group or choose to create new user group for it. You also need to select the bucket and the VMware Cloud Director compute resource for the new organization.
2.5.1.2 2. Create a User

Next you need to create a new end user account. During the creation process select the organization you've added (Step 1). You also need to select a VMware Cloud Director role for the user from the drop-down list.

2.5.1.3 3. Deploy Resources

Once the organization and user have been created, the end user will be able to log in to OnApp. The final step is to provide resources for the new user. There are several ways of doing that:

- Use a pre-defined Orchestration Model. Orchestration Models are a quick way to get started, as they deploy a resource pool, organization network(s) and storage policies in one wizard.
- Allow the customer to log in with no pre-defined resources. They can deploy a resource pool and organization networks from the VCD sidebar in the OnApp Control Panel.
- Deploy resources on behalf of your customer via VMware Cloud Director. They will automatically synchronize with OnApp via RabbitMQ.

See also:

- VMware Cloud Director Virtual Servers
- VMware Cloud Director Buckets
- Create and Manage vApp Networks

2.5.2 Create and Manage Users

OnApp provides control over cloud users and what they're allowed to do. You can set up as many different types of users as you need, and customize their access to cloud resources and Control Panel functions as required.

Users with the following roles can view users of their user group:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator
- vCloud Console Access Only

Additionally, users with the vCloud Organization Administrator role can create, edit, and delete users within their user group.

You can create VMware Cloud Director users in OnApp. This process will add a user both to vCloud and OnApp. The user creation form is standard for OnApp, the fields that will synchronize user data with vCloud are: Login, Password, User Role, User Group, First and Last Name, and Email.

After you add a user, the change will be synchronized to VMware Cloud Director. When you assign the VMware Cloud Director user that you add in OnApp to an Organization (user group), you define the resources the new user will have access to.

If in VCD you delete a user from a user group with which several organizations from different VCDs are associated, the user will be...
removed but will be recreated after the synchronization. The reason is that the user exists in all organizations within one user group. If you delete such users in OnApp, they are removed from all organizations in the user group.

2.5.2.1 Create User

1. Go to your Control Panel > Cloud > Users menu. You’ll see a list of all user accounts in your cloud.
2. Click the Create User button at the bottom of the list.
3. Fill in the user creation form step by step:

   **Step 1 of 4**
   - Move the Use Gravatar slider to the right to use the gravatar image.
   - **Login** - provide user login name. It can consist of 2-40 characters, letters [A-Za-z], digits [0-9], dash [-], lower dash [ _], [@]. You can use both lower- and uppercase letters. This will be the user’s VMware Cloud Director e-mail.
   - **First name** - specify user first name. It can consist of any 1-20 characters.
   - **Last name** - specify user last name. It can consist of any 1-20 characters. The First name and Last name comprise the user’s full name in VMware Cloud Director.
   - **Email** - specify user email. This will be the user’s email in the VMware Cloud Director database.
   - **Time zone** - select the required time zone from the drop-down box.
   - **Locale** - specify user locale settings by selecting the appropriate locale from the drop-down box (see the Locales section for details).
   - **Password** - specify user password and confirm it. The password can consist of 6-40 characters and must meet the password complexity requirements. This will be the user’s VMware Cloud Director password.
   - **Repeat password** - repeat user password
   - **Additional info** - fill in a custom field, created using the additional fields functionality, with corresponding information
   - **Display infoboxes** - move the slider to the right to display guidance infoboxes for the user.
   - Click **Next**.

   The VMware Cloud Director **Phone** and **IM** fields will be left blank when the user is created via OnApp.

   The value 'unlimited' will be set automatically for the VMware Cloud Director **All VMs quota** and **Running VMs quota** fields.
Step 2 of 4

- **User group** - assign user to the user group by selecting the required user group from the drop-down box. Assign a user to VMware Cloud Director Organization(s). If you select several user groups the user will belong to several organizations at the same time and have access to the resources of these organizations.

- **User role** - select one of the VMware Cloud Director roles for this user.

> OnApp supports both default and custom VCD roles. Default vCloud roles are mapped using the label, therefore, please do not change the labels of the default user roles in VMware Cloud Director. The custom role will not appear in the user creation wizard if the role does not exist in all organizations under a certain user group. Custom roles are not synchronized between the organizations in a user group, therefore, you will be required to add the same custom role in VCD for all organizations in a user group.

- Click Next.

Step 3 of 4

- Assign user to the bucket by selecting the required bucket from the drop-down box.
- Click Next.

Step 4

- Specify Auto-suspending options if any. You can configure the system to suspend a user at a definite time or in several hours after creation.

> If you set Suspend settings for a user, the suspend action at OnApp will disable the user in VMware Cloud Director.

4. Click the Save button to finish.

2.5.2.2 Edit User

1. Go to your Control Panel > **Cloud** > **Users** menu. You'll see a list of all user accounts in your cloud.
2. Click the **Edit** icon next to the user you want to edit.
3. Change their details as required on the screen that appears:
   - Move the **Use Gravatar** slider to the right to use the gravatar image.
   - **Login** - provide user login name. It can consist of 2-40 characters, letters [A-Za-z], digits [0-9], dash [-], lower dash [ _ ], [@]. You can use both lower- and uppercase letters. This will be the user's VMware Cloud Director user name.
   - **First name** - specify user first name. It can consist of any 1-20 characters.
   - **Last name** - specify user last name. It can consist of any 1-20 characters. The First name and Last name comprise the user's full name in VMware Cloud Director.
Email - specify user email. This will be the user’s email in the VMware Cloud Director database.

Time zone - select the required time zone from the drop-down box.

Locale - specify user locale settings by selecting the appropriate locale from the drop-down box (see the Locales section for details).

System theme - specify the desirable theme for the user CP look and feel. By default, the global cloud settings are applied.

Password - specify user password and confirm it. The password can consist of 6-40 characters and must meet the password complexity requirements. This will be the user’s VMware Cloud Director password.

Repeat password - repeat user password

Display infoboxes - move the slider to the right to display guidance infoboxes for the user.

Bucket - select the required bucket from the drop-down box.

User roles - select one of the VMware Cloud Director roles for this user.

User group - assign user to the user group by selecting the required user group from the drop-down box. Assign a user to VMware Cloud Director Organization(s). If you select several user groups the user will belong to several organizations at the same time and have access to the resources of these organizations.

Auto suspending - edit the auto-suspending options.

4. Click the Save button to finish.

Pay attention to the following points regarding the VMware Cloud Director users:

- When you change the First or Last Name, the VMware Cloud Director Full Name value is edited.
- When you change the Password, the password in VMware Cloud Director is also changed.
- When you change the user role, the user’s role in VMware Cloud Director is also updated.
- You cannot change the user's user group (organization).
- If you set Suspend settings for a user, the suspend action at OnApp will disable the user in VMware Cloud Director.
- User without the Administrator Control permission has no ability to edit own first name, last name and email fields.

2.5.2.3 Delete User

Completely deleting a user from the system is a two-step process.

- When you delete VMware Cloud Director users in OnApp, they are completely erased in the VMware Cloud Director.
• You can delete a user but transfer the resources associated with the user to you.

• If in VCD you delete a user from a user group with which several organizations from different VCDs are associated, the user will be removed but will be recreated after the synchronization. The reason is that the user exists in all organizations within one user group. If you delete such users in OnApp, they are removed from all organizations in the user group.

2.5.2.3.1 Step 1. Deleting Users
To delete a user:
1. Go to your Control Panel > Cloud > Users menu. You'll see the list of all user accounts in your cloud.
2. Click the Actions icon next to the user you want to remove and click Delete.
3. In the confirmation window, you can select the Transfer user's objects to me checkbox. If you don't select the checkbox, all resources associated with the user are deleted.
4. Click the Confirm button.
5. Enter your admin password and click Confirm.

To enable confirmation of the user deletion by means of a password, go to Admin > Settings > Configuration > Defaults tab and move the Enable password protection on user deleting slider to the right. Otherwise, the password protection will be disabled by default.

After the deletion, the resources associated with the user are transferred to you if you selected the Transfer user's objects to me checkbox. If you don't select the checkbox, all the user resources are deleted except for recipes. Recipes that run on other user's resources are not deleted after their owners are removed. These recipes can be accessed via Recipes > Unowned Recipes menu. The user with global permissions can become an owner of any of the unowned recipes by choosing Actions > Become an owner.

2.5.3 Create and Manage Organizations
In vCloud, an organization is a unit of administration for a collection of users, groups, and computing resources. Users authenticate at the organization level, supplying credentials established by an organization administrator when the user was created or imported. System administrators create and provision organizations, while organization administrators manage organization users, groups, and catalogs.
vCloud organizations when imported into OnApp are associated with user groups. User groups define the bucket under which the users in the organization are billed. You can view/create/delete organizations at the OnApp Control Panel.

When an organization is created or deleted at the OnApp Control Panel, it is synchronized with VMware Cloud Director and a new organization is created or deleted in VCD.

You can view the list and details of user groups if you are a user with one of the following roles:

- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator
- vCloud Console Access Only

### 2.5.3.1 Multiple vCloud Mode

We support multiple organizations within a single user group to enable you to provide your customers with the ability to manage resources located in different VMware Cloud Director instances from a single UI. With multiple vCloud mode, you can configure and get all done within the OnApp platform with no additional configuration of VCD.

To enable Multiple vCloud Mode:

1. Ensure that you have added multiple VMware Cloud Director instances to OnApp. You can check it by visiting your Control Panel > Admin > Settings > Compute Resources.

2. Ensure that the VCD instances have been configured for Multiple vCloud mode. This basically removes the direct mapping between User Group <> Organization, enabling you to create an organization and assign to a new or existing user group of your choice:
   
   a. Go to your Control Panel > Admin > Settings > Compute Resources.
   
   b. Click on the label for the compute resource you are interested in.
   
   c. On the page that loads, click Tools > Switch to Multiple vCloud Mode.

Once you have changed the mode, you will not be able to change it back.

Now while creating a new organization, you will get the option to assign it to an existing User Group or create a new one.

If you have existing organizations that do not belong to a user group, you import organizations from vCloud and then assign them to an existing group or create a new one.

Now the users will have a single view of resource pools across multiple VMware Cloud Director instances, improving their ability to create highly available and resilient services.
2.5.3.2 View Organizations

1. Go to your Control Panel > Cloud > Organizations menu.
2. Click an organization's label to see the compute resource and the user group the organization is associated with.
3. Click the number of users to see the list of users assigned to this user group.

2.5.3.3 Create Organizations

1. Go to your Control Panel > Cloud > Organizations and click Add New Organization.
2. On the page that loads, fill in the following parameters:
   - Label - the name of the organization
   - Compute Resource - the VCD compute resource with which the new organization is to be associated
   - Automatically create User Group? - whether you wish to create a new user group with which this organization will be associated. If you enable this slider, a new user group with the label of this organization will be created and will contain this organization. If you do not enable this option, you can associate this organization with an already existing user group.

   Note that your existing user group should have at least one bucket assigned. Otherwise, the organization creation will fail.

   - User Group - the user group with which this organization is to be associated. This parameter applies only if you disable the Automatically create User Group? slider.
   - Company Billing Plan - the bucket for the user group that is to be created once to create this organization. This parameter applies only if you enable the Automatically create User Group? slider.
3. Click Submit to save create the new organization.

2.5.3.4 Import Organizations

When importing VCD resources you can choose whether you wish your users to be associated with one or several VMware Cloud Director instances. If you wish your users to have access to
multiple VMware Cloud Director instances, you can set up several organizations in OnApp to be associated with a single user groups and have access to resources across multiple VCD instances. For such configuration, VCD compute resources should be imported in **multiple VCloud Director mode** at your Control Panel > **Admin > Settings > Compute Resources > Add New Compute Resource**. In this mode you select which organization is imported and is associated with a certain user group. After the initial import, changes to the organization will be synchronized between VCD and OnApp.

To import an organization:

1. Go to your Control Panel > **Admin > Settings > Compute Resources > Label**.
2. The page that loads shows the details of your VCD compute resource. Click **Tools** and select **Import Organization from vCloud**.
3. Move the *Import* slider to the right next to the organization(s) you wish to import.
4. Select a user group to which you wish to assign the organization in the **Assign to User Group** field. If you do not select a user group but enable the *Import* slider, a new user group will be created for this organization. If you select a user group that is already associated with one or several organizations, the users from the new organization will be created in the already present organizations and the users from the already present organizations will be created in the new user group.
5. Click **Submit** to import the organizations.

**2.5.3.5 Delete Organizations**

1. Go to your Control Panel > **Cloud > Organizations**.
2. Click the **Actions** icon next to the organization you wish to remove.
3. Select **Delete**. Once the organization is removed in OnApp it will also be removed in VCD.

**2.5.3.6 User Groups**

Organizations are associated with OnApp user groups. If there are several organizations associated with one user group, the users from one organization will be created in other organizations in the user group. In this case, users will have access to multiple VCD instances. User groups define the bucket under which the users in the organization are billed.

To give users access to multiple VCD instances, you need to select the **multiple vCloud Director mode** for the VCD compute resource during **import configuration**.

**2.5.3.6.1 View User Groups**

For VMware Cloud Director Organizations the following parameters are displayed on the user group details page at your Control Panel > **Admin > Groups**:

- **Roles** - the list of roles, assigned to users of the user group
- **Organizations** - vCloud user groups
- **Bucket** - the bucket assigned to this user group
- **User Buckets** - bucket available for the users of this group
- **Monthly fee** - the money amount which has to be paid on a monthly basis according to the bucket
- **Price per hour** - the price per hour including the total for all resources that are billed on an hourly basis for the last hour
- **Price per month** - the price per month including the total for all resources that are billed on a monthly basis
- **Price per hour (including discount)** - the price per hour including the total for all resources that are billed on an hourly basis for the last hour with the discount included (if any)
- **Price per month (including discount)** - the price per month including the total for all resources that are billed on a monthly basis with the discount included (if any)
- **Paid Amount** - the already paid money amount
- **Total Amount** - the total money amount according to the bucket
- **Discount due to free** - the amount that will be deducted from the invoice because there are free resources in the bucket
- **Total Amount with Discount** - the sum total for the resource usage after discount due to free deduction
- **Outstanding Amount** - the money amount which has to be paid (total amount minus paid amount)
- **Payments** - click this link to see the list of payments. To manage payments, go to the Billing > Payments menu. For more info refer to the Payments section of this guide.
- **Monthly bills** - click this link to see the list of monthly bills
- **Service Addons Stats** - click this link to see the service add-on billing statistics and total amount. That will show the amount due for the service add-on usage for all the users in the group that have assigned the service add-ons to their VSs.
- **User Group Billing Report** - click this link to see the billing statistics for all the resources used by users within this user group. For more information, refer to the section below.
- **Resource Pools** - the list of the resource pools associated with the organization

2.5.3.6.2 **View User Group Billing Report**

The **User Group Report** page displays billing statistics for the specified period of time for all resources used by users within the user group.

To view the billing report for a particular user group:
1. Go to your Control Panel > Admin > Groups menu.
2. Click a label of a destination user group.
3. Click the **User Group Billing Report** link.
4. Filter statistics for a particular period of time and click the **Apply** button. On the page that follows, you can see the following details:
   - **From** - the start date for generating statistics
   - **Till** - the end date for generating statistics
   - **Virtual Server** - the label of the virtual server that you can click to view the VS details
   - **User** - the username of the VS owner that you can click to view the user profile
   - **Resource Pool** - the price for the usage of resource pool for the selected period of time
   - **Storage** - the price for the usage of storage resources for the selected period of time
- **Network** - the price for the usage of network resources for the selected period of time
- **Service Add-ons** - the price for the usage of service add-ons for the selected period of time
- **Total Cost** - the price for all used resources (Resource Pool, Storage, Network, and Service Add-ons) for the selected period of time

To download a CSV file with statistics for a selected period of time, click the **Save as CSV** button. The download will start automatically after you click the button.

### 2.5.3.6.3 Create User Group

To create a new user group with default bucket and all roles:

1. Go to your Control Panel > **Admin > Groups** menu.
2. Click the “+” button or the **Create Group** button.
3. On the screen that appears, fill in the organization creation form:
   - **Label** - choose a name for the organization
   - **Buckets** - choose the bucket from the drop-down list
   - **Assign vCloud roles** - move this slider to the right to assign VCD roles to the user group
   - **Roles** - the roles for the users in the group
   - **User Buckets** - the buckets for the user group
4. Click **Save**.

After you create a user group, you can assign organizations to it during the import.

### 2.5.3.6.4 Edit User Group

1. Go to your Control Panel > **Admin > Groups** menu.
2. Click the label of the required organization.
3. Click the **Edit** icon in the upper right corner.
4. On the page that loads, make the necessary changes:
   - **Label** - choose a name for the organization
   - **Buckets** - choose the bucket from the drop-down list
   - **Assign vCloud Roles** - move this slider to the right to assign VCD roles to the user group
   - **Roles** - the roles for the users in the group
   - **User Buckets** - the buckets for the user group
5. Click **Save**.

### 2.5.3.6.5 Delete User Group

1. Go to your Control Panel > **Admin > Groups** menu.
2. Click **Delete** in the **Actions** list next to a user group to delete a specific group.

2.5.4 VMware Cloud Director Credentials

VMware Cloud Director system administrators are not automatically imported into OnApp from VMware Cloud Director (as, in this case they will automatically get access to all the OnApp functions). Alternatively, OnApp administrators can set their own VMware Cloud Director credentials to be able to log into VMware Cloud Director and manage VMware Cloud Director resources with OnApp.

Also OnApp administrators can create system administrators in their OnApp cloud and assign administrator roles to them at their own risk. After that system administrators can log in to OnApp and then set their VCD credentials by themselves. Administrators can also set the VMware Cloud Director password for their users.

The following VMware Cloud Director credentials are displayed on the user profile page:

- Login - the user’s VMware Cloud Director login
- Password - click the Change Password link to edit the user’s VMware Cloud Director credentials

2.5.4.1 Set System Administrator Credentials

1. Click the Create Credentials button.
2. On the screen that appears, set the VMware Cloud Director login and password to be able to manage vCloud resources Director with OnApp.
3. Click Save.

2.5.4.2 Set VMware Cloud Director User Password

1. Click the Change Password button.
2. On the screen that appears, set the VMware Cloud Director password.
3. Click Save.

If you (or your system administrator) change your vCloud password on vCloud side, it is required to update the password on the OnApp side to sync. Once the credentials become out-of-sync, you will see a notification to update your vCloud credentials at the bottom of the screen. Click Manage vCloud Credentials to update the password.

API info

- API key - click the Generate key button to generate a new API key.
2.5.5 VMware Cloud Director Roles

OnApp supports both custom and default VCD roles. Default roles are mapped using the label, therefore, please do not change the labels of the default user roles in VMware Cloud Director. The custom role will not appear in the user creation wizard if the role does not exist in all organizations under a certain user group. Custom roles are not synchronized between the organizations in a user group, therefore, you will be required to add the same custom role in VCD for all organizations in a user group.

To enable all VMware Cloud Director roles on the User Group level, select the Assign vCloud Roles checkbox while creating or editing a user group to which the organization will belong.

The roles created in VCD after the original import won't be directly synchronized into the OnApp CP. All the updates will appear after the resync that occurs every 24 hours. If you create one and want to add it into OnApp immediately, you can run manual sync of VMware Cloud Director.

2.5.5.1 List of Roles

vCloud Organization Administrator
A user with the predefined Organization Administrator role can manage users and groups in their organization and assign them roles, including the predefined Organization Administrator role. Roles created or modified by an Organization Administrator are not visible to other organizations.

vCloud Catalog Author
The rights associated with the predefined Catalog Author role allow a user to create and publish catalogs.

vCloud vApp Author
The rights associated with the predefined vApp Author role allow a user to use catalogs and create vApps.

vCloud vApp User
The rights associated with the predefined vApp User role allow a user to use existing vApps.

vCloud Console Access Only
The rights associated with the predefined Console Access Only role allow a user to view virtual machine state and properties and to use the guest OS.
vCloud Defer to Identity Provider

Rights associated with the predefined Defer to Identity Provider role are determined based on information received from the user's OAuth or SAML Identity Provider. To qualify for inclusion when a user or group is assigned the Defer to Identity Provider role, a role or group name supplied by the Identity Provider must be an exact, case-sensitive match for a role or group name defined in your organization.

- If the user is defined by an OAuth Identity Provider, the user is assigned the roles named in the roles array of the user's OAuth token.

- If the user is defined by a SAML Identity Provider, the user is assigned the roles named in the SAML attribute whose name appears in the RoleAttributeName element, which is in the SamlAttributeMapping element in the organization's OrgFederationSettings.

You must manually assign a role to such users.

2.5.5.2 Rights Included in VMware Cloud Director Roles

Except the Defer to Identity Provider role, each predefined role includes the following set of default rights:

2.6 Buckets and Limits

In this chapter, you can find information on how to manage buckets and limits:

- VMware Cloud Director Buckets
- Payments
- Restrictions Sets

2.6.1 VMware Cloud Director Buckets

OnApp provides a possibility to limit which resources should be allocated to customers, and charge users for what they actually consume. For this, it is required to create a bucket, set prices and resource limits, and then assign users to that bucket. Buckets can be assigned to individual users and to organizations imported into OnApp.

This functionality is available for users with the vCloud Organization Administrator role. As a user with the vCloud Organization User role, you can only view your own buckets.

Buckets enable you to set up resources allocation and pricing separately. They are subdivided into two subsections:

- **Access Control** - in this section you configure the resources allocation for the users under this bucket. If you assign a bucket to a user, that user will have access only to those resources which you have added to the bucket. If no resources are added to a section of the Access Control, e.g. compute zones, the user under the bucket will not have access to any of the compute zones in the cloud.
• **Rate Card** - in this section you set up prices for the resources and the amount of resources users can request for free. Users under the bucket will be billed according to the prices you configure in the Rate Card. In the Rate Card, you can set the pricing type: hourly or monthly.

For convenience, you can duplicate resources from the Access Control to the Rate Card and vice versa. When adding a resource to the Access Control tick the **Duplicate to rate card** checkbox and the resource will be added to the Rate Card with no prices and free limits by default. Similarly, when adding a resource to the Rate Card tick the **Duplicate to access control** checkbox and the resource will be added to the access control with no limits by default.

These tabs are further subdivided into sections that depend on the server types of resources you have in the cloud. The VMware Cloud Director resources have the VPC server type.

Buckets functionality is applicable to three models of resources allocation of VMware Cloud Director resource pools - Pay-As-You-Go, reservation pool and allocation pool. If you are allocating resources to your customers based on these VMware Cloud Director resource pools, you can charge customers for the block of resources (CPU, RAM, storage, & network etc.) assigned to their user group.

You can set two types of billing for each resource:

• **Hourly** - the number of used resources is calculated hourly and users are charged per hour for the usage of resources.

• **Monthly (on peak usage)** - the number of used resources is calculated monthly and users are charged once per month (on the first day of a month for the preceding month) for a peak value of a resource usage. The peak value is the highest value that occurred throughout a month (e.g. from 01.04.2019 00:00 to 30.04.2019 23:59).

2.6.1.1 Before you Begin

• Be careful when deleting or editing resources in buckets assigned to users or user groups and which have been used to build servers, as any changes will affect these servers. For example, if you have a server running on a template and the template’s store is removed from the bucket, the server will remain running but it will not be possible to edit it. Therefore, we advise to clone the required bucket and make the necessary changes in the cloned version.

• Ensure that **Buckets** and **Resource Pool Statistics** permissions are on before creating a bucket. For more information about permissions, refer to the VMware Cloud Director Permissions section of this guide.

• Be aware that the maximum value that you can set is $10^{13}$.

Below you can find instructions on how to create and manage buckets and billing statistics.

2.6.1.2 Create Bucket

To create a bucket:

1. Go to your Control Panel > Admin > Buckets menu.

2. On the screen that appears, click the + button or click **New Bucket** at the bottom of the screen.

3. Complete the form on the screen that appears:
   - Label – enter a name for the bucket
   - Monthly price – set a monthly price for the bucket. This price will be applied regardless of the actual prices for used resources.
Be aware that the maximum value that you can set is 10^{13}.

- **Currency** - set a currency to charge in.

4. Specify Windows licensing support settings:
   - Tick the **Allows mak** box to enable MAK licensing for a user signed up for this bucket
   - Tick the **Allows kms** box to allow using KMS service
   - Choose **Allows own** to permit inserting custom licenses

5. Click **Save** to finish.

### 2.6.1.3 Configure Resource Allocation and Prices

- A resource pool is allocated to an organization, and the organization is associated with a compute resource of a specific compute zone. Thus, when you set limits and pricing for a specific compute zone, it means that these prices are set for all resource pools associated with this compute zone.

- The amount of free resources is given to an organization as a total amount for all VMware Cloud Director resources in the compute zone. The minimum/maximum amounts and prices are set for each VMware Cloud Director resource pool in the compute zone.

### 2.6.1.3.1 Configure Access Control

Access control is used to manage availability of resources to users. For the newly created bucket, the Access Control is empty, and that means that no resources are available to a user to whom this bucket is assigned. To make compute, disk space, or networking resources available, add the corresponding zones to a bucket.

- If you do not add resources to a section of Access Control, e.g. compute zone, the user under this bucket will not have access to any of the compute zones in the cloud.

- If you remove a template store or compute/data store/network/backup server zone from the Access Control, it will not be possible to edit the resources of the servers running in this zone(s).

To manage resources allocation:

1. Go to your Control Panel > **Admin** > **Buckets** menu.

2. Click a label of a bucket. You will be redirected to the **Access Control** tab of the bucket.

3. Click an icon to select the required server type (VPC) and add resources as follows:
• Click the + in the appropriate box.
• When the new windows pops up, set limits for resources (see the table below for reference).
• Select the **Duplicate to rate card** checkbox if you want to set free limits and prices for the resources.

| Limits for compute zones Pay-As-You-Go | CPU Quota | Min Max | • The minimum amount of CPU (in GHz) users can request for each VMware Cloud Director resource pool in the compute zone.  
• The maximum amount of CPU quota (in GHz) users can request for each VMware Cloud Director resource pool in the compute zone.  
Leave the '-' value to provide an unlimited amount of CPU Quota within the compute zone to a user under this bucket. |
| vCPUs | Min Max | • The minimum amount of vCPUs (in cores) users can request for each VMware Cloud Director resource pool in the compute zone.  
• The maximum amount of vCPUs (in cores) users can request for each VMware Cloud Director resource pool in the compute zone.  
Leave the '-' value to provide an unlimited amount of vCPUs within the compute zone to a user under this bucket. |
| Memory Quota | Min Max | • The minimum amount of Memory quota (in GB) users can request under this bucket  
• The maximum amount of Memory quota (in GB) users can request under this bucket.  
Leave the '-' value to provide an unlimited amount of RAM Quota within the compute zone to a user under this bucket. |

CPU quota is a CPU limit in terms of resource pool creation. Min/max amounts of CPU quotas affect the range within which you can set CPU limits during resource pool creation/edit. If min/max amounts of CPU quota is set to unlimited, that allows you to set unlimited CPU and memory during resource pool creation/edit. Otherwise, the unlimited option will not be available during resource pool creation/edit.

Memory quota is the name of the resource which controls the memory limit at resource pool creation. Min/max amounts of memory quotas affect the range within which you can set memory limits during resource pool creation/edit. If min/max amounts of CPU and memory quotas are set to unlimited, that allows you to set unlimited CPU and memory during resource pool creation/edit. Otherwise, the unlimited option will not be available during resource pool creation/edit.
- CPU quota is a CPU limit in terms of resource pool creation (memory quota is the memory limit respectively).
- Min/max amounts of CPU and memory quotas affect the range within which you can set CPU and memory limits during resource pool creation/edit.
- If min/max amounts of CPU and memory quotas are set to unlimited, that allows you to set unlimited CPU and memory during resource pool creation/edit. Otherwise, the unlimited option will not be available during resource pool creation/edit.

### Other Resources

#### 2.6.1.3.2 Other Resources

#### 2.6.1.3.3 Configure Rate Card

Rate Card is used to manage the prices and the amount of free limits for resources. For the newly created bucket, the Rate Card is empty, and that means that a user, to whom this bucket is assigned, is not billed for any of the resources in the system. To configure pricing for compute, disk space, or networking resources, add the corresponding zones to the bucket's Rate Card.
• If you add a resource to the Rate Card but do not add it to the Access Control, the user under this bucket will not have access to that resource.

• In case you remove from Access Control a resource on which users under the bucket have running servers, the users’ existing servers will remain as they are, but users will not be able to access these resources to create new servers. If you leave such a resource in the Rate Card, the users’ existing servers will continue to be billed according to the prices you have configured.

• If you remove a template store or compute/data store/network/backup server zone from the Rate Card, the prices for the removed resource will be set to zero for the servers using this zone(s).

• If you want to disable prices completely you can do so by enabling the *Disable billing* slider at the *Edit System Configuration* page. When the billing is disabled, the Rate Cards are removed from existing buckets. Note that if billing is enabled again, the prices won’t be recalculated again. Instead, the price calculation will start with the next hour.

To manage pricing for the resources:

1. Go to your Control Panel > **Admin** > **Buckets** menu.
2. Click a label of a bucket. You will be redirected to the *Access Control* tab of the bucket.
3. Click the *Rate Card* tab.
4. Click an icon to select the required server type and add resources as follows:
   - Click the + in the appropriate section.
   - When the new window pops up, set the value for the free limit and the price (see the table below for reference).
   - Select the **Duplicate to access control** checkbox if you want to add the resource not only to Rate Card but also to Access Control.

2.6.1.4 Assign Users to Bucket

You can assign a bucket to an individual user while creating or editing a user profile.

To assign a bucket to a new user:

1. Go to your Control Panel > Admin > Users menu. The page that loads shows all the users in your cloud.
2. Click the + icon or the Create User button. You will be forwarded to the first step of the user creation wizard.
3. Fill in the login, first and last name, email and password for the new user and click **Next**.

4. At the second step of the user creation process select the required VMware Cloud Director user group and one or several vCloud roles for the user from the drop-down lists. Click **Next** to proceed.

5. Select the bucket under which the user will be billed. Click **Next** to proceed to the final step of the user creation process.

6. Set the auto suspending options if required and click **Save** to create the user. The new user will be able to log into OnApp with the credentials you have specified during creation and will be billed according to the bucket you have selected.

To assign a bucket to an existing user:

1. Go to your Control Pane > Admin > Users menu. The page that loads shows all the users in your cloud.

2. Click the **Actions** icon next to the user to which you want to assign a bucket.

3. To assign a certain bucket to a user, select the required bucket from the drop-down list in the **Buckets** field. On this page, you can also change other details of the user account, e.g., login, email, password, etc.

4. Click **Save** to change the details of the user profile. After this process the user will be billed according to the bucket you have selected.

### 2.6.1.5 Assign Organizations to Bucket

You can assign a user group to a bucket while creating a new organization.

The total number of **VMware Cloud Director Virtual Servers** created by all users in the group cannot exceed the **Virtual Servers** limit set in the bucket for that user group. The exact number of VSs that can be allocated to each user in the group is not predefined in the group's bucket. Therefore, when one group member uses, for example, half of the group's bucket VS limit, the remaining amount of VSs is left for the rest of users in the group even if they have not reached the VS limit set in their individual bucket. If the VS bucket limit is reached, users will not be able to create new virtual servers. Currently, such behavior is implemented only for the Virtual Servers functionality.

To assign a bucket to the user group:

1. Go to your Control Panel > Cloud > Organizations menu.

2. Click the + icon or the **Add new Organization** button.

3. On the screen that appears, fill in the organization details:
   
   - **Label** - type a name for the organization
   - **Compute Resource** - the VCD compute resource with which the new organization is to be associated
   - **Automatically create User Group?** - whether you wish to create a new user group with which this organization will be associated. If you enable this slider, a new user group with the label of this organization will be created and will contain this
organization. If you do not enable this option, you can associate this organization with an already existing user group.

- **User Group** - the user group with which this organization is to be associated. This parameter applies only if you disable the *Automatically create User Group?* slider.
- **Company Billing Plan** - the bucket for the user group that is to be created for this organization. This parameter applies only if you enable the *Automatically create User Group?*

4. Click **Submit** to create a new organization.

The newly created organization will have the following roles:

- If you select to automatically create a new user group for this organization, all VMware Cloud Director roles are assigned to this organization by default and cannot be further changed.
- If you select an existing user group, the organization inherits roles from this user group settings.

To enable all VMware Cloud Director roles on the User Group level, select the **Assign vCloud Roles** checkbox while creating or editing a user group to which the organization will belong.

### 2.6.1.6 View List of Users Assigned to Bucket

You can view the list of users assigned to a bucket from the buckets list page.

To view the list of users assigned to a bucket:

1. Go your Control Panel > **Admin** > **Buckets**. The page that loads lists all the buckets in your cloud.
2. In the **Associated with users** column click the number next to the bucket you are interested in. This number indicates how many active users are associated with this bucket. You will be forwarded to the list of users to whom the bucket is assigned. The users which have been deleted or deactivated are not shown at this list.
3. Click the user’s Full Name to view the account details or click the Actions icon next to the user to edit, delete or perform other action related to this user.

### 2.6.1.7 Edit Bucket

To edit a bucket:

1. Go to your Control Panel > **Admin** > **Buckets** menu.
2. Click the **Actions** button next to the required bucket and then click **Edit**.
3. Change the required settings and click the **Save** button.

- Editing a bucket that is associated with more than one user will affect all users attached to it. If you want to affect only a particular user, copy the bucket, assign it to this user and then edit the bucket.
• When a bucket is edited, the new monthly price will apply starting with the following month. For the current month, the monthly price from the previous month is taken.

2.6.1.8 Copy Bucket

To copy a bucket:
1. Go to your Control Panel > Admin > Buckets menu. The screen that appears will show all the buckets currently set up on the cloud.
2. Click the Actions icon next to a required bucket, then click Copy.
3. You will be forwarded to the Access Control section of the copied version of the original bucket. The copy will be displayed in the bucket's list at Control Panel > Buckets with a label consisting of ‘Bucket clone of’ and the name of the original bucket, e.g. ‘Bucket Clone of Test.Bucket’.

2.6.1.9 Delete Bucket

To delete a bucket:
1. Go to your Control Panel > Admin > Buckets menu. The screen that appears will show all the buckets currently set up in the cloud.
2. Click the Delete icon next to a bucket to remove it from the system. You'll be asked for confirmation before the bucket is removed.

Deleting a bucket that is associated with more than one user will affect all users attached to it. If you want to delete or change the bucket for a particular user, go to the Users menu and edit the bucket in the user profile.

2.6.1.10 Billing Statistics

The billing statistics on used VMware Cloud Director resources and prices for them is collected from VMware Cloud Director resource pools. Buckets for VMware Cloud Director resource pool types includes charging for the block of resources (CPU, RAM, storage, network, etc.) assigned to your organization.

Statistics are not collected on a resource pool if the compute zone is not added to the bucket.
To view VMware Cloud Director resource pool billing statistics:

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.
2. Click the label of a specific resource pool.
3. Click the Billing Statistics tab.
4. The page that loads will show the following details of the billing statistics:
   - **Date**: particular date and hour for the generated statistics
   - **User Group**: the label of user group (VMware Cloud Director organization), to which the bucket is assigned. Click the user group name to see its details.
   - **Resource Pool**: the resource pool name with the total due for VMware Cloud Director resources for the point of time specified in the Date column.
   - **Network Usage**: the network name with the total due for VMware Cloud Director resources for the point of time specified in the Date column.
   - **Storage Policy Usage**: the storage policy name with the total due for VMware Cloud Director resources for the point of time specified in the Date column.
   - **Costs**: the total due for the Resource Pools, Network Usage including sub-allocated IP addresses, and Storage Policy Usage at the point of time specified in the Date column.

To generate statistics for a particular time period:

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.
2. Click the label of a specific resource pool.
3. Click the Billing Statistics tab.
4. At the top of the table set Start and End time for which you want to generate the billing statistics.
5. Tick the Show in my timezone checkbox if you want to show billing statistics according to your profile's timezone settings.
6. Click Apply.

### 2.6.2 Payments

OnApp provides a possibility to add information about payments to OnApp Control Panel. Payments are already paid invoices for used resources according to buckets. There are two types of payments in OnApp: user payments and company payments. User payments are those which you charge for the resources created on KVM compute resources. Company payments are those for the VMware Cloud Director integration resources. If you do not have the VMware Cloud Director integration, the Company Payments tab will be missing.
Ensure that the Payments permissions are on before managing payments.

Ensure that the See own company payments and Monthly user group billing statistics permissions are on before managing a company payment and monthly bills.

For more information, refer to the VMware Cloud Director Permissions section of this guide.

Below you can find instructions on how to view, create, and manage company payments.

**This functionality is available for users with the following roles:**
- vCloud Catalog Author
- vCloud vApp Author
- vCloud vApp User
- vCloud Organization Administrator
- vCloud Console Access Only

### 2.6.2.1 View User Payments

1. Go to your Control Panel > Admin > Payments menu.
2. On the page that appears, you will see the list of all payments together with their details:
   - User – the name of a user, who made the payment
   - Payment Date – the date when the payment was done
   - Amount – the money amount which was paid
   - Invoice Number – the serial number of a paid invoice
   - Actions – click the Actions button to edit or delete a payment

You can filter the list of payments by user - select the user from the drop-down menu and click the **Apply** button.

### 2.6.2.2 View Company Payments

1. Go to your Control Panel > Admin > Payments menu.
2. Click the Company Payments tab.
3. On the page that appears, you will see the list of all payments together with their details:
   - Payment Date – the date when the payment was done
   - Company – the name of a user group, whose user conducted the payment
   - Invoice Number – the serial number of a paid invoice
   - Amount – the money amount which was paid
You can filter the list of payments by user group - select the user group from the drop-down menu and click the Apply button.

To view monthly bills:
1. Go to your Control Panel > Admin > Groups menu.
2. Click the label of a specific user group.
3. On the following page, you will see the details of this user group. Click the Monthly Bills link.
4. On the page that appears, you will get the list of bills which shows the total due per each month of the year selected from the drop-down menu. To view billing statistics, select a year from the drop-down menu and click the Apply button.

2.6.2.3 Create Company Payment

1. Go to your Control Panel > Admin > Payments menu.
2. Select the Company Payments tab.
3. On the page that appears, you will see the list of all payments. Click the New Payment button or the + or the New Payment button.
4. Complete the form on the screen that follows:
   - **Company** – the name of a user group, whose user conducted the payment
   - **Invoice Number** – the serial number of a paid invoice
   - **Amount** – the money amount which was paid
5. Click Save.

2.6.2.4 Edit Company Payment

1. Go to your Control Panel > Admin > Payments menu.
2. Select the Company Payments tab.
3. On the page that appears, you will see the list of all payments. Click the Actions button next to the payment you want to edit, then click Edit.
4. Make changes on the screen that follows:
   - **Company** – write the name of a user group, whose user conducted the payment
   - **Invoice Number** – put the serial number of a paid invoice
   - **Amount** – change the money amount which was paid
5. Click Save.

2.6.2.5 Delete Company Payment

1. Go to your Control Panel > Admin > Payments menu.
2. Select the Company Payments tab.
3. On the page that appears, you will see the list of all payments. Click the Actions button next to the payment you want to delete, then click Delete.
4. Confirm the deletion.
2.6.3 Restrictions Sets

For more information on the restrictions resources, refer to the Restrictions Sets section.

Restrictions sets can limit the following VMware Cloud Director resources:

<table>
<thead>
<tr>
<th>Resource</th>
<th>Restriction Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Org Networks</td>
<td>by bucket</td>
<td>The vCloud user can manage org networks, which reside in the network zone associated with VCD bucket.</td>
</tr>
<tr>
<td>vApps</td>
<td>by user group</td>
<td>The vCloud user can manage only vApps which run in the vCloud organization (user group).</td>
</tr>
<tr>
<td>vApp Templates</td>
<td>by user group</td>
<td>The vCloud user can manage only vApp templates in the vCloud organization (user group).</td>
</tr>
<tr>
<td>Catalogs</td>
<td>by user group</td>
<td>The vCloud user can manage only vApp template catalogs in the vCloud organization (user group).</td>
</tr>
<tr>
<td>vDCs</td>
<td>by user group</td>
<td>The vCloud user can manage virtual DataCenters which exist in the vCloud Organization (user group).</td>
</tr>
<tr>
<td>vDC Storage Profiles</td>
<td>by user group</td>
<td>The vCloud user can manage Storage profiles associated with virtual DataCenters in the vCloud Organization (user group).</td>
</tr>
<tr>
<td>vCloud Credentials</td>
<td>by user group</td>
<td>The vCloud users can manage vCloud credentials only of those users, who are assigned to their vCloud organization (user group).</td>
</tr>
</tbody>
</table>

2.7 VMware Cloud Director Resources

In this chapter, you can find information on how to manage the following resources for VMware Cloud Director:

- Compute Resources
- Orchestration Models
- Resource Pools
- Provider Resource Pools
- Storage Policies

2.7.1 Compute Resources

The VMware Cloud Director Instance is imported into OnApp as a compute resource (vcloud type). First you need to create a VMware Cloud Director compute zone and then a vCloud compute resource which should be attached it to the zone. After you add a VMware Cloud Director compute resource, your VCD resources are imported into OnApp.
• After you create a VMware Cloud Director compute zone you need to attach compute resources, networks and backup servers to it. Keep in mind that you can attach only those resources related to the VMware Cloud Director compute zone.

• You cannot remove a VMware Cloud Director compute resource from a compute zone.

2.7.1.1 Create VMware Director Compute Zones

1. Go to your Control Panel > Admin > Settings menu and click the Compute Zones icon.

2. Press "+" or click the Create Compute Zone button.

3. On the screen that follows the parameters, you need to fill in the next properties:
   - **Label** - give your compute zone a name.
   - **Server type** - choose the server type from the drop-down box. Choose the Virtual Private Cloud server type to create a VMware Cloud Director server zone. Only VMware Cloud Director compute resources can be attached to a zone of this type. The zone's type cannot be changed after the zone is created.
   - **Location group** - select the location group to which this compute zone will be assigned.
   - **Failover timeout** - time period for which the iterations will run during the failover if the compute resource does not respond.

4. After you fill in all the parameters click the Save button.

2.7.1.2 Create VMware Cloud Director Compute Resources

When importing VCD resources you can choose whether you wish your users to be associated with one or several VMware Cloud Director instances. If you wish your users to have access to multiple VMware Cloud Director instances, you can set up several organizations in OnApp to be associated with a single user groups and have access to resources across multiple VCD instances.

- **single vCloud Director mode** - all resources are imported from the VCD instance. Each organization is imported as a separate user group which can be associated with one VCD instance.

- **multiple vCloud director mode** - only system level entities are imported (provider VDCs, external networks, etc.). Organizations are imported but are empty, i.e. do not contain resources and users. After the initial import you can select which organization you wish to import and associate with a certain user group. Users imported in this mode can be configured to have access to multiple VCD instances.

To create a VCD compute resource:

1. Go to your Control Panel > Admin > Settings menu.

2. Click the Compute Resources icon.

3. Press the + button or click the Add New Compute Resource button underneath the list of compute resources on the screen.

4. On the screen that appears:
- **Label** - enter a compute resource label.
- **Compute resource type** - choose a Compute resource type, in this case **vcloud**.
- **Compute zone** - select the compute zone of VPC type
- **Operation mode** - select whether you wish to import the zone in the single or multiple VMware Cloud Director mode. If you select the multiple VMware Cloud Director, you need to later import the resources of an organization and its users.

---

You can later switch from single VMware Cloud Director mode to the multiple VMware Cloud Director mode if required. In this case, the new organizations will no longer be synchronized from VCD to OnApp. It will be required to import each new organization.

You cannot switch from multiple to single VMware Cloud Director mode.

- **API URL** - set the VMware Cloud Director API URL - e.g. [https://example.com](https://example.com)
- **Login** - specify the VMware Cloud Director system admin login
- **Password** - specify the VMware Cloud Director system admin password
- **AMQP Exchange Name** - specify your VMware Cloud Director AMQP exchange name (this can be taken in your VMware Cloud Director instance Extensibility > Settings > Exchange)

5. Click the **Save** button. The Compute resource will be added to the system. You can view it under the **Compute resources** menu. Click the **Back** button to return to the **Compute resource Settings** page.

---

**If you have selected the multiple VMware Cloud Director mode for the compute resource, you need to import organizations.**

---

2.7.2 Orchestration Models

VMware Cloud Director orchestration models let you provide your customers with a ready environment which they can use to deploy virtual servers. The administrator creates and deploys orchestration models. In their turn, customers receive a VMware Cloud Director environment with configured resource pool(s), network(s) and data store(s). This page describes how you can add orchestration models using OnApp.

Using OnApp you can view, create, edit, deploy, clone, and delete orchestration models. When you deploy an orchestration model you create a new VDC on the VMware Cloud Director side. CPU, memory, network, and data store resources associated with the new VDC are configured according to the parameters you set during the orchestration model creation and deployment.

- Ensure that Orchestration Models permissions are on before managing orchestration models. For more information about permissions, refer to the VMware Cloud Director Permissions section of this guide.
- This functionality is available for users with the vCloud Organization Administrator role.

2.7.2.1 View Orchestration Models

To view orchestration models, go to your Control Panel > Cloud > Orchestration Models in the VMware Cloud Director section. The page that loads shows the list of orchestration models with their labels and the particular VMware Cloud Director to which each template is associated.

Click the VMware Cloud Director label next to the template you are interested in to view the details of the VMware Cloud Director compute resource associated with it.

Click the label of a orchestration model to view its details:

Properties
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **Label** - the name of the orchestration model
- **Compute Resource** - the compute resource associated with the orchestration model
- **Provider Resource Pool** - select from the drop-down list the provider VDC that will be used when an organization VDC will be deployed from the orchestration model.

**Compute Options**

- **VDC Model Type** - the resource pool type: Allocation Pool, Reservation Pool or Pay-As-You-Go

There are three types of resource pools:

- **Allocation Pool** - a percentage of the resources you allocate from the provider virtual datacenter are committed to the organization virtual datacenter. You can specify the percentage for both CPU and memory.
- **Pay-As-You-Go** - resources are committed only when users create vApps in the organization virtual datacenter.
- **Reservation Pool** - all of the resources you allocate are immediately committed to the organization virtual datacenter.

- The array of resources with the minimum, maximum, and default values the end client can order and information on whether the end client can change and see the values. The parameters apply to a certain VDC model type selected previously. For details see the [Orchestration Models API](#).

**Network Options**

- **Default Network** - the network pool for the selected compute resource
- **Deploy edge gateway** - whether an edge gateway will be deployed or not.
- **Edge gateway name** - the label for the new edge gateway. The default name is MyEdgeGateway. This field appears only when the **Deploy edge gateway** option is enabled.
- **Create networks** - the networks that will be created during orchestration model deployment with their details:
  
  - **Network Name** - the label for the network
  - **Type** - the type of the network: direct, routed or isolated.
  - **Network Address** - the network address in "x.x.x.x/x" format.
  - **DNS** - DNS for the network.

**Storage**

- **Enable thin provisioning** - whether thin provisioning is enabled
- **Enable fast provisioning** - whether fast provisioning is enabled
- **Data store option choices** - the settings for data stores:
  
  - **Label** - the name of the data store zone(s) in which data stores will be created during orchestration model deployment.
  - **Minimum** - the minimum data store size (GB) that can be requested during orchestration model deployment
  - **Maximum** - the maximum data store size (GB) that can be requested during orchestration model deployment
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **Default** - the default data store size (GB) that will be set during orchestration model deployment. If the data store options are not set as customizable and/or visible, the default data store size will be applied during orchestration model deployment.

- **Customizable** - whether the data store size can be altered during orchestration model deployment

- **Visible** - whether the data store zone will be listed during orchestration model deployment. If the data store zone is not visible, a data store will still be created in it.

### 2.7.2.2 Create Orchestration Model

To create an orchestration model, go to your Control Panel > **Cloud** > **Orchestration Models** in the VMware Cloud Director section and click **New Orchestration Model**. On the page that loads fill in the form:

#### Properties
- **Label** - the name of the orchestration model
- **Compute Resource** - select the compute resource associated with the orchestration model from the drop-down list
- **Provider Resource Pool** - select from the drop-down list the provider VDC that will be used when an organization VDC will be deployed from the orchestration model.

#### Compute Options
- **VDC model type** - select the resource pool type: Allocation Pool, Reservation Pool or Pay-As-You-Go.

There are three types of resource pools:

- **Allocation Pool** - a percentage of the resources you allocate from the provider virtual datacenter are committed to the organization virtual datacenter. You can specify the percentage for both CPU and memory.
- **Pay-As-You-Go** - resources are committed only when users create vApps in the organization virtual datacenter.
- **Reservation Pool** - all of the resources you allocate are immediately committed to the organization virtual datacenter.

- **VDC Properties** - for the array of resources specify the minimum, maximum and default values the end client can order and whether the end client can change and see the values. The parameters shown depend on the VDC model type selected previously:

<table>
<thead>
<tr>
<th>Resource</th>
<th>Allocation Pool</th>
<th>Reservation Pool</th>
<th>Pay-As-You-Go</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU Allocation (GHz)</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>CPU Resource Guaranteed (%)</td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>CPU Quota (GHz)</td>
<td></td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>vCPU Speed (MHz)</td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>Resource</td>
<td>Allocation Pool</td>
<td>Reservation Pool</td>
<td>Pay-As-You-Go</td>
</tr>
<tr>
<td>---------------------------</td>
<td>-----------------</td>
<td>------------------</td>
<td>---------------</td>
</tr>
<tr>
<td>Memory Allocation (GB)</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>Memory resources guaranteed (%)</td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>Memory Quota (GB)</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Number of VMs</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Network Quota</td>
<td></td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

**Network Options**

- **Default network pool** - choose a network pool for the selected compute resource from the drop-down list
- **Deploy edge gateway** - move the slider to deploy an edge gateway. If an edge gateway is not deployed, you will not be able to configure routed networks within the orchestration model.
- **Edge gateway name** - fill in the label for the new edge gateway. The default name is MyEdgeGateway. This field appears only when the Deploy edge gateway option is enabled.
- **Create networks** - move the slider to create networks when the template is deployed. If you select to create networks, click the + button to add a new network(s). For each of the networks double-click the fields to provide the following details, some fields apply only to certain network types:
  - **Default Name** - the label for the network
  - **Type** - the type of the network: routed, isolated or direct networks. You can add routed networks only when the Deploy edge gateway option is enabled in the orchestration model.
  - **Network Address** - fill in the network address in "x.x.x.x/x" format.
  - **DNS** - DNS for the network.

**Data Store Options**

- **Enable thin provisioning** - move the slider to enable thin provisioning
- **Enable fast provisioning** - move the slider to enable fast provisioning
- **Data stores to create** - fill in the settings for data stores. Click the + button to add a data store zone from the drop-down list. The list will contain data store zones associated with the compute resource you have selected. For each of the data store zones provide the following details (double-click the values to change):
  - **Minimum** - the minimum data store size (GB) that can be requested during orchestration model deployment
  - **Maximum** - the maximum data store size (GB) that can be requested during orchestration model deployment
  - **Default** - the default data store size (GB) that will be set during orchestration model deployment. If the data store options are not set as customizable and/or visible, the default data store size will be applied during orchestration model deployment.
  - **Customizable** - move the slider to select whether the data store size can be altered during orchestration model deployment
Visible - whether the data store zone will be listed during orchestration model deployment. If the data store zone is not visible, a data store will still be created in it.

Use - move the slider to select whether a data store will be created in this data store zone during orchestration model deployment

If the orchestration model properties do not suit the resources’ min/max criteria in VMware Cloud Director Buckets, then you will not be able to create this orchestration model.

2.7.2.3 Edit Orchestration Model

1. Go to your Control Panel > Cloud > Orchestration Models in the VMware Cloud Director section.
2. Click the Actions button next to an orchestration model that you want to edit.
3. Click the Edit button and modify the following properties:

   Properties
   o Label - the name of the orchestration model
   o Compute Resource - select the compute resource associated with the orchestration model from the drop-down list
   o Provider Resource Pool - select from the drop-down list the provider VDC that will be used when an organization VDC will be deployed from the orchestration model.

Compute Options

o VDC Model Type - select the resource pool type: Allocation Pool, Reservation Pool or Pay-As-You-Go.

There are three types of resource pools:

- **Allocation Pool** - a percentage of the resources you allocate from the provider virtual datacenter are committed to the organization virtual datacenter. You can specify the percentage for both CPU and memory.
- **Pay-As-You-Go** - resources are committed only when users create vApps in the organization virtual datacenter.
- **Reservation Pool** - all of the resources you allocate are immediately committed to the organization virtual datacenter.

o VDC Properties - for the array of resources specify the minimum, maximum and default values the end client can order and whether the end client can change and see the values. The parameters shown depend on the VDC model type selected previously:
<table>
<thead>
<tr>
<th>Resource</th>
<th>Allocation Pool</th>
<th>Reservation Pool</th>
<th>Pay-As-You-Go</th>
</tr>
</thead>
<tbody>
<tr>
<td>CPU Allocation (GHz)</td>
<td>✓</td>
<td>✓</td>
<td></td>
</tr>
<tr>
<td>CPU Resource Guaranteed (%)</td>
<td></td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>CPU Quota (GHz)</td>
<td></td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>vCPU Speed (MHz)</td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>Memory Allocation (GB)</td>
<td>✓</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Memory resources guaranteed (%)</td>
<td>✓</td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>Memory Quota (GB)</td>
<td></td>
<td></td>
<td>✓</td>
</tr>
<tr>
<td>Number of VMs</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
<tr>
<td>Network Quota</td>
<td>✓</td>
<td>✓</td>
<td>✓</td>
</tr>
</tbody>
</table>

**Network Options**

- **Default network pool** - choose a network pool for the selected compute resource from the drop-down list.
- **Deploy edge gateway** - move the slider to deploy an edge gateway. If an edge gateway is not deployed, you will not be able to configure routed networks within the orchestration model.
- **Edge gateway name** - fill in the label for the new edge gateway. The default name is MyEdgeGateway. This field appears only when the **Deploy edge gateway** option is enabled.
- **Create networks** - move the slider to create networks when the template is deployed. If you select to create networks, click the + button to add a new network(s). For each of the networks double-click the fields to provide the following details, some fields apply only to certain network types:
  - **Default Name** - the label for the network
  - **Type** - the type of the network: routed, isolated or direct networks. You can add routed networks only when the **Deploy edge gateway** option is enabled in the orchestration model.
  - **Network Address** - fill in the network address in "x.x.x.x/x" format.
  - **DNS** - DNS for the network.

**Data Store Options**

- **Enable thin provisioning** - move the slider to enable thin provisioning
- **Enable fast provisioning** - move the slider to enable fast provisioning
- **Data stores to create** - fill in the settings for data stores. Click the + button to add a data store zone from the drop-down list. The list will contain data store zones associated with the compute resource you have selected. For each of the data store zones provide the following details (double-click the values to change):
- **Minimum** - the minimum data store size (GB) that can be requested during orchestration model deployment
- **Maximum** - the maximum data store size (GB) that can be requested during orchestration model deployment
- **Default** - the default data store size (GB) that will be set during orchestration model deployment. If the data store options are not set as customizable and/or visible, the default data store size will be applied during orchestration model deployment.
- **Customizable** - move the slider to select whether the data store size can be altered during orchestration model deployment
- **Visible** - whether the data store zone will be listed during orchestration model deployment. If the data store zone is not visible, a data store will still be created in it.
- **Use** - move the slider to select whether a data store will be created in this data store zone during orchestration model deployment

If the orchestration model properties do not suit the resources' min/max criteria in **VMware Cloud Director Buckets**, then you will not be able to edit this orchestration model.

4. Click the **Submit** button to apply the settings.

### 2.7.2.4 Clone Orchestration Model

1. Go to your Control Panel > **Cloud** > **Orchestration Models** in the VMware Cloud Director section.
2. Click the **Actions** button next to an orchestration model that you want to clone.
3. Click **Copy** and click **OK** to confirm the action.

### 2.7.2.5 Deploy Orchestration Model

1. Go to your Control Panel > **Cloud** > **Orchestration Models** in the VMware Cloud Director section.
2. Click the **Actions** button next the template you want to deploy and select **Deploy**.
3. On the page that loads, configure the resources assigned to the VMware Cloud Director created from this VDC template:
   
   **General**
   - **Organization** - select the organization with which the orchestration model will be associated
   - **Resource Pool Label** - enter a label for a resource pool that will be created after the template is deployed

   **CPU Resources**
   - **CPU Allocation** - amount of CPU resources (GHZ) that will be allocated after the template is deployed
• **CPU Guaranteed** - amount of guaranteed CPU allocation (%)
• **vCPU Speed** - the vCPU speed that can be consumed after the template is deployed (MHz)

**Memory Resources**
• **Memory** - the amount of memory (MB) that will be allocated after the template is deployed
• **Memory Guaranteed** - amount of guaranteed memory allocation (%)
• **VS Number** - the number VSs that can be created after the template is deployed

**Storage**
• **Default Storage Policy** - select the default storage policy

**Network**
• **Edge gateway name** - the name of the edge gateway
  • **Edge gateway uplink networks** - select one or several external networks
  • **Default gateway** - select the default gateway
  • **Use default gateway for DNS relay** - move this slider to the right to use default gateway for DNS relay

The networks that will be assigned to the newly created VDC with their details:
• **Network Name** - the label for the network
• **Type** - the type of the network: routed, isolated or direct
• **Network Address** - the network address in "x.x.x.x/x" format
• **DNS** - DNS for the network

Click **Next** to proceed.

**Confirmation**
Review the details of the VMware Cloud Director you are going to deploy.
If you are satisfied with the configurations, click the **Submit** button to deploy the orchestration model.
If you want to change any of the resources, click the **Previous** button and make the necessary changes.

2.7.2.6 Delete Orchestration Model

1. Go to your Control Panel > **Cloud** > **Orchestration Models** in the VMware Cloud Director section.

2. Click the **Actions** button next the template that you want to remove and select **Delete**. You will be asked for confirmation before the template is removed.

**See also:**
• **Manage VMware Cloud Director VSs**
2.7.3 Resource Pools

A VMware Cloud Director resource pool is an allocation model which determines how and when the provider virtual data center compute and memory resources are committed to the organization virtual data center.

There are three types of resource pools:

- **Allocation Pool** - a percentage of the resources you allocate from the provider virtual data center are committed to the organization virtual data center. You can specify the percentage for both CPU and memory.

- **Pay-As-You-Go** - resources are committed only when users create vApps in the organization virtual data center.

- **Reservation Pool** - all of the resources you allocate are immediately committed to the organization virtual data center.

You can view, create, edit, and delete resource pools using OnApp Control Panel.

This functionality is available for users with the vCloud Organization Administrator role.

2.7.3.1 View Resource Pool

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.

2. The page that loads will show the list of resource pools with their details:

   - **Label** - the name of the resource pool
   - **Status** - whether the resource pool is enabled or not. When a resource pool is disabled, the memory and compute resources of the resource pool are no longer available.
   - **Type** - the type of the resource pool: Allocation Pool, Pay-As-You-Go or Reservation Pool.
   - **Organization** - the organization associated with the resource pool
   - **User Group** - the user group associated with the resource pool
   - **CPU (GHz)** - the used and total CPU reservations for the resource pool, in GHz
   - **Memory (GB)** - the used and total memory reservations for the resource pool, in GB
   - **Actions** - click the Actions button to edit or delete the resource pool

   The search box at the top right corner of the page allows you to search a Resource Pool by its label.

To view VMware Cloud Director resource pool details:

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.

2. Click the label of a specific resource pool.

3. The page that loads will show the following details of the resource pool:
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **Label** - the name of the resource pool
- **User Group** - the user group associated with the resource pool
- **Organization** - the organization associated with the resource pool
- **Allocation Model** - the type of the resource pool
- **VS Quota** - the quota of VSs
- **Network Quota** - the quota of org networks that you can create in the resource pool
- **Enabled** - whether this resource pool is enabled or not
- **Fast Provisioning** - whether the fast provisioning is enabled for this resource pool or not
- **Thin Provisioning** - whether the thin provisioning is enabled for this resource pool or not
- **CPU** - the amount of Allocated CPU, Reserved CPU, Used CPU and percentage of guaranteed CPU
- **vCPU Speed** - the speed of vCPU (in MHz)
- **Memory** - the amount of Allocated Memory, Reserved Memory, Used Memory and percentage of guaranteed Memory
- **Data Stores** - the list of data stores within the resource pool. The following parameters are displayed for each of the data stores: label, disk usage, disk capacity, whether the data store is enabled or not. Click the **Actions** button to edit/delete a data store.

Information on the **Used** resource pool resources (CPU and Memory) is updated every 3 minutes by default.

Also, you can customize resource pool statistics period using the following configuration in **on_app.yml** file:

```
vcloud_stats_level2_period: <period in second>
```

It is recommended to set the value between 1 and 5 minutes for effective stats gathering.

### 2.7.3.1.1 Manage Firewalls

Make sure the **Manage Firewalls** permission is on before managing firewalls. For more information about permissions, refer to the [VMware Cloud Director Permissions](#) section of this guide.

Firewalls are used to route VS networking traffic in and out of OnApp. Because all customer VSs are running inside the network, firewalls are required as the VS gateway.

To manage firewall rules:

1. Go to your Control Panel > **Cloud** > **Resource Pools** menu.
2. Click a label of a resource pool.
3. Click the Manage Firewall tab.

You will be redirected to the vCloud to the manage firewall for the VCD page.

- To learn how to manage firewalls, refer to Add an Edge Gateway Firewall Rule Using the Tenant Portal guide.
- To learn more about grouping objects, refer to Custom Grouping Objects guide.
- To get more information about security tags, refer to Working with Security Tags guide.

2.7.3.2 Create Resource Pool

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.
2. Click the + button.
3. On the screen that appears, fill in the resource pool creation form:
   - Label - specify a name for the resource pool
   - Organization - select the organization that will be associated with the resource pool
   - Provider vdc - choose the provider resource pool from the drop-down list
     Ensure that Provider resource pools permissions are on. For more information about permissions, refer to the Permissions section.
   - Allocation Model - choose the type of the resource pool. Depending on the selected type, the compute resource options will differ:

   **Compute Resources**

   **Pay-As-You-Go**
   - CPU limit - specify the maximum amount of CPU (in GHz) that can be requested (or tick the check box below to set CPU limit to unlimited)
   - Guaranteed CPU - specify the amount of guaranteed CPU allocation (%)
   - vCPU Speed - specify the vCPU speed that can be consumed after the resource pool is created (in MHz)
   - Memory limit - specify the maximum amount of memory (in GB) which can be used (or tick the check box below to set Memory limit to unlimited)
   - Guaranteed memory - specify the amount of guaranteed memory allocation (%)
   - VS Quota - specify the number of VSs that can be created after the resource pool is deployed (or tick the check box below to set VS quota to unlimited)
   - Network Quota - enter the number of org networks that can be created after the resource pool is deployed

   - CPU limit is equal to CPU quota in a bucket (memory limit - to memory quota respectively).
• Min/max amounts of CPU and memory quotas in the bucket influence boundaries, within which you can set CPU and memory limits.
• If min/max amounts of CPU and memory quotas are set to unlimited in the bucket, you can set unlimited CPU and memory limits by ticking the checkbox, otherwise, unlimited option will not be available.

Allocation Pool
- **CPU allocated** - specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created
- **Guaranteed CPU** - specify the amount of guaranteed CPU allocation (%)
- **vCPU Speed** - specify the vCPU speed that can be consumed after the resource pool is created (in MHz)
- **Memory allocated** - specify the amount of memory (in GB) allocated to this resource pool
- **Guaranteed memory** - specify the amount of guaranteed memory allocation (%)
- **VS Quota** - specify the number of VSs that can be created after the resource pool is deployed (or tick the check box below to set VS quota to unlimited)
- **Network Quota** - enter the number of org networks that can be created after the resource pool is deployed

Reservation Pool
- **CPU allocated** - specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created
- **Memory allocated** - specify the amount of memory (in GB) allocated to this resource pool
- **VS Quota** - specify the number of VSs that can be created after the resource pool is deployed (or tick the check box below to set VS quota to unlimited)
- **Network Quota** - enter the number of org networks that can be created after the resource pool is deployed

Network Options
- **Default Network Pool** - choose the default network pool from the drop-down list. This network pool is used when adding isolated and routed networks to the resource pool. If there is no network pool associated with a resource pool, you will not be able to add isolated and routed networks to the resource pool.
NSX-T resource pools/OvDCs (Organization Virtual Datacenters) cannot be used without a default network pool.

**Datastore Options**

- **Thin Provisioning** - move the slider to the right to enable thin provisioning for this resource pool
- **Fast Provisioning** - move the slider to the right to enable fast provisioning for this resource pool
- **Data Store Zone** - choose the data store zone which is a provider's storage policy in VMware Cloud Director from the drop-down list. The selection will be limited by the company plan's resources.
- **Disk Capacity** - the size of the data store that will be created. The capacity range depends on the company plan's limits. For the Pay-As-You-Go resource pools, you can select the *Unlimited* (∞) checkbox. After you create a resource pool, a new data store (storage policy) will be automatically created with the capacity set during resource pool creation in the selected data store zone.

4. Click the **Submit** button.

### 2.7.3.3 Edit Resource Pool

1. Go to your Control Panel > **Cloud > Resource Pools** menu to see an overview of all resource pools in the cloud.
2. Click the **Actions** button next to the resource pool you want to edit, then click **Edit**.
3. On the screen that appears, edit the necessary parameters, depending on the resource pool type:
   - **Label** - specify a name for the resource pool

**Compute resources**

**Pay-As-You-Go**

- **CPU limit** - specify the maximum amount of CPU (in GHz) that can be requested (or tick the check box below to set **CPU limit** to unlimited)
  - **Guaranteed CPU** - specify the amount of guaranteed CPU allocation (%)
  - **vCPU Speed** - specify the vCPU speed that can be consumed after the resource pool is created (in MHz)
  - **Memory limit** - specify the maximum amount of memory (in GB) which can be used (or tick the check box below to set **Memory limit** to unlimited)
  - **Guaranteed memory** - specify the amount of guaranteed memory allocation (%)
- **VS Quota**: specify the number of VSs that can be created after the resource pool is deployed (or tick the check box below to set VS quota to unlimited).
- **Network Quota**: enter the number of org networks that can be created in the resource pool.

### Allocation Pool

- **CPU allocated**: specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created.
- **Guaranteed CPU**: specify the amount of guaranteed CPU allocation (%).
- **vCPU Speed**: specify the vCPU speed that can be consumed after the resource pool is created (in MHz).
- **Memory allocated**: specify the amount of memory (in GB) allocated to this resource pool.
- **Guaranteed memory**: specify the amount of guaranteed memory allocation (%).
- **VS Quota**: specify the number of VSs that can be created after the resource pool is deployed (or tick the check box below to set VS quota to unlimited).
- **Network Quota**: enter the number of org networks that can be created in the resource pool.

### Reservation Pool

- **CPU allocated**: specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created.
- **Memory allocated**: specify the amount of memory (in GB) allocated to this resource pool.
- **VS Quota**: specify the number of VSs that can be created after the resource pool is deployed (or tick the check box below to set VS quota to unlimited).
- **Network Quota**: enter the number of org networks that can be created in the resource pool.

### Network Options

- **Default Network Pool**: choose the network pool from the drop-down list. This network pool is used when adding isolated and routed networks to the resource pool. If there is no network pool associated with a resource pool, you will not be able to add isolated and routed networks to the resource pool.

### Datastore Options

- **Thin Provisioning**: move the slider to the right to enable thin provisioning for this resource pool.
- **Fast Provisioning**: move the slider to the right to enable fast provisioning for this resource pool.

4. Click the **Submit** button.
2.7.3.4 Delete VMware Cloud Director Resource Pool

You can delete a resource pool that contains no vApps, Org Networks, or catalogs with templates. To delete a VMware Cloud Director resource pool:

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.
2. Click the Actions button next to the resource pool you want to delete and click Delete.
3. Click OK to confirm the deletion.

2.7.3.5 Resource Pool Data Stores

You can add new data stores and edit or delete existing data stores from the resource pool overview page at Control Panel > Cloud > Resource Pools > Label. For more information, refer to Storage Policies.

2.7.3.5.1 Add Resource Pool Data Stores

1. Go to your Control Panel > Cloud > Resource Pools menu to overview all resource pools in the cloud.
2. Click a label of a resource pool to which you want to add a new data store.
3. On the resource pool overview page, click the + button in the Data Stores section.
4. Fill in the form that appears:
   - Data Store Zone - select the data store zone in which the data store will be created
   - Enabled - select the option to enable the data store. By default, all the newly created data stores are enabled.
   - Make default - select the option to make the data store a default one. You cannot delete or disable a default data store.
   - Disk Capacity - move the slider to specify the size of the data store. For the Pay-As-You-Go resource pools, you can select the Unlimited (∞) checkbox.
5. Click the Submit button to add the data store.

2.7.3.5.2 Edit Resource Pool Data Stores

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.
2. Click a label of the required resource pool.
3. In the Data Stores section, click the Actions button next to the data store you want to update and select Edit.
4. Update the required fields in the form that appears:
   - Enabled - move the slider to select whether the data store should be enabled or not
   - Make default - select the option to make the data store a default one. You cannot delete or disable a default data store.
   - Disk Capacity - move the slider to specify the size of the data store. For the Pay-As-You-Go resource pools, you can select the Unlimited (∞) checkbox.
5. Click the Submit button to save the changes.

2.7.3.5.3 Delete Resource Pool Data Stores

1. Go to your Control Panel > Cloud > Resource Pools menu to see an overview of all resource pools in the cloud.
2. Click the label of the required resource pool.
3. In the data stores section, click the **Actions** button next to the data store you want to remove and select **Delete**.

### 2.7.3.6 Resource Pool Billing Statistics

**VMware Cloud Director Buckets** statistics about used VMware Cloud Director resources is gathered from VMware Cloud Director resource pools. Three types of VMware Cloud Director resource pools are used for billing statistics - reservation and allocation pools and pay-as-you-go. The bucket for these VMware Cloud Director resource pool types will include charging for the block of resources (CPU, RAM, storage, & network etc.) assigned to your user group.

- Statistics are not collected on a resource pool if the compute zone is not added to the bucket.
- Statistics for VMware Cloud Director external networks is generated only for networks based on vSphere Distributed Switch (VDS) port groups but not on vSphere **Standard Switch (VSS)** ones.

#### 2.7.3.6.1 View and Generate Statistics

1. Go to your Control Panel > **Cloud** > **Resource Pools** menu to see an overview of all resource pools in the cloud.
2. Click the label of a specific resource pool.
3. Click the **Billing Statistics** tab.
4. The page that loads will show the following details of the billing statistics:
   - **Date** - particular date and time for the generated statistics
   - **User Group** - the label of user group, to which the bucket is assigned. Click the user group name to see its details.
   - **Resource Pool** - the resource pool name with the total due for VMware Cloud Director resources for the point of time specified in the Date column.
   - **Network Usage** - the network name with the total due for VMware Cloud Director resources for the point of time specified in the Date column.
   - **Storage Policy Usage** - the storage policy name with the total due for VMware Cloud Director resources for the point of time specified in the Date column.
   - **Costs** - the total due for the **Resource Pools** and **Storage Policy Usage** at the point of time specified in the Date column.
   - **Total Amount** - the total due for all **Resource Pools** and **Storage Policy Usage** for a given period of time.

To generate statistics for a particular time period:

The statistics for the selected period might be missing if the resource pool didn't exist, or statistics archiving was turned on. For information on statistics archiving, refer to the **Archive Statistics** section below.

1. Go to your Control Panel > **Cloud** > **Resource Pools** menu to see an overview of all resource pools in the cloud.
2. Click the label of a specific resource pool.

3. Click the **Billing Statistics** tab.

4. At the top of the table set Start and End time for which you want to generate the billing statistics.

5. Tick the **Show in my timezone** checkbox if you want to show billing statistics according to your profile's timezone settings.

6. Click **Apply**.

Also, you can customize resource pool statistics period using the following configuration in `on_app.yml` file:

```
vdc_stats_delay: <period in second>
```

### 2.7.3.6.2 Archive Statistics

If required, you can turn on resource pool statistics archiving. If this feature is enabled, hourly statistics will be converted into monthly and then stored as an archive.

To configure statistics archiving:

1. Go to your Control Panel > **Admin > Settings** menu, and click the **Configuration** icon.

2. Click the **System** tab.

3. Configure the following settings in the **Statistics Management** section:
   
   - **Enable hourly statistics archiving** - move the slider to the right to switch on archiving for hourly statistics. If enabled, hourly statistics will be converted into monthly and stored as archive for all the period that exceeds the time specified in the **Time of hourly statistics storage (months)** parameter below.
   
   - **Time of hourly statistics storage (months)** - this parameter configures how long you want the detailed hourly statistics to be stored in database before being converted into monthly statistics. For example, if you set this parameter to 10, the hourly statistics will be stored for the last 10 months. And everything older than 10 months will be sent to archive (that is converted into monthly statistics). If this parameter is set as 1, then you can view the detailed hourly statistics for the current month only. Set this parameter at least as 2 to keep the statistics for the previous month available.

4. Click the **Save Configuration** button to finish. Saving the configuration will restart OnApp services.

2.7.4 Provider Resource Pools

A VMware Cloud Director resource pool is an allocation model which determines how and when the provider virtual data center compute and memory resources are committed to the organization virtual data center. You can view the provider resource pools with details on available resources from the Control Panel.

This functionality is available for users with the vCloud Organization Administrator role.

2.7.4.1 View Provider Resource Pools

You can access the Cloud > Provider Resource Pools page from your Control Panel. The page provides the following information about the available resource pools:

- **Label** - the name of the provider resource pool
- **Enabled** - the status that indicates whether the resource pool is enabled or not
- **Hypervisor** - the VMware Cloud Director compute resource
- **CPU (GHz)** - the number of used / total CPU and the percentage of used CPU in GHz
- **Memory (GB)** - the number of used / total memory and the percentage of used memory in GB

To view details on a particular provider resource pool, see the following section.

2.7.4.2 View Provider Resource Pool Details

To view details of a provider resource pool, go to Control Panel > Cloud > Provider Resource Pools and click a label of a destination pool. You can see the following information on the provider resource pool:

- **Properties**
  - **Label** - the name of the provider resource pool
  - **Enabled** - the status that indicates whether the resource pool is enabled or not
  - **Hypervisor** - the VMware Cloud Director compute resource
  - **CPU** - the number of **Allocated**, **Used**, and **Total** CPU in GHz
  - **Memory** - the number of **Allocated**, **Used**, and **Total** memory in GB

- **Data Store Groups**
  The list of data stores available within the provider resource pool. To see more details on a specific data store, click its label.

- **Network Groups**
  The list of networks available within the provider resource pool. To see more details on a specific network, click its label.

- **External Networks**
  The list of external (public) networks available within the provider resource pool. To see more details on a specific network, click its label.

See also:
2.7.5 Storage Policies

VMware Cloud Director provider storage policies are imported into OnApp and appear in the OnApp UI as data store zones. Whereas storage policies are imported as data stores. These data stores are assigned to the data store zones of the VPC type that are the provider storage policies with which the storage policies are associated. Storage policies are not only imported but can also be created in OnApp.

The storage policies are created in OnApp in the following cases:

- During the orchestration model deployment. The newly created storage policies will be associated with the provider storage policies set in data store options.
- During the resource pool creation and modification. The newly created storage policy will be associated with the provider storage policy set on the resource pool page or creation form.

You can select storage policies during the vApp creation. You can create, edit, and delete storage policies when managing resource pools. For more information, refer to Resource Pools.

2.7.5.1 View Storage Policies

1. Go to your Control Panel > Admin > Settings > Data Stores menu.
2. On the screen that appears, you will see the list of all data stores within a cloud and their details:
   - Label - the name of the storage policy
   - IP address - the IP address of the storage policy
   - Shared? - whether the storage policy is shared between several compute resources or not
   - Identifier - the identifier of the data store
   - Data Store Zone - the data store zone to which the storage policy is assigned. The label of the data store zone consists of the following parts: “Storage Policy Name (pVDC Name) - Compute Resource Name”.
   - Location Group - the location group to which this data store is assigned
   - Disk Usage - the number of GB used by the VS disks assigned to this storage policy
   - Disk Capacity - the disk capacity of this storage policy
3. Click the label of the storage policy you are interested in to view the disks and VSs associated with this storage policy.
You can also view the list of storage policies assigned to a certain resource pool at Control Panel > Cloud > Resource Pools > Label. On this page, you can add new storage policies or edit/delete the existing ones.

### 2.7.5.2 Manage Data Store Zone

1. Go to your Control Panel > Admin > Settings > Data Store Zones menu.
2. On the screen that appears, you will see the list of the VMware Cloud Director data store zones. The label of the data store zone consists of the following parts: "Storage Policy Name (pVDC Name) - Compute Resource Name". Click the label of the data store zone to view the storage policies assigned to this data store zone.
3. If you want to edit a data store zone label, click the Actions button and then click Edit.
4. If you want to delete a data store zone, click the Actions button and then click Delete. Confirm the deletion.

### 2.8 Networking

In this chapter, you can find information on how to manage the following networking settings for VMware Cloud Director:
- Organization Networks
- NAT Rules
- Firewall Rules
- Cross VDC Networks
- External Networks
- VPN Services

#### 2.8.1 Organization Networks

VMware Cloud Director organization networks enable communication between vApps within a VMware Cloud Director organization. You can view, create, edit, and delete VMware Cloud Director Organization networks using OnApp. Any changes that you make via OnApp regarding Organization networks are synchronized with VMware Cloud Director and vice versa.

This functionality is available for users with the vCloud Organization Administrator role.

#### 2.8.1.1 View Organization Networks
To view the list of Organization networks, go to your Control Panel > **Cloud** > **Org Networks** menu. The page that loads shows the list of VMware Cloud Director Organization networks and their details:

- **Label** - the name of the network
- **Edge Gateway** - the edge gateway associated with the network. Click this label to view the details of the edge gateway.
- **Gateway Address** - the IP address of the gateway
- **Network Mask** - mask of the network
- **Resource Pool Owner** - the resource pool associated with the network. Click this label to view the details of the resource pool.
- **User Group** - the organization associated with the organization network

Click ▶ at the top of the screen, and you will be redirected to the VCD UI, where you can add the organization network. Click the Organization network label to view its details:

- **Label** - the name of the network
- **Status** - the status of the network, whether it is switched on or not
- **Type** - the type of the network. It can be routed, isolated or direct.
- **Edge Gateway** - the edge gateway associated with the network. Click this label to view the details of the edge gateway.
- **Gateway Address** - the IP address of the gateway
- **Network Mask** - IP of the network mask
- **Use gateway DNS** - whether gateway DNS is applied to the network or not
- **Primary DNS** - IP address of the primary domain name system (DNS) server
- **Secondary DNS** - IP address of the secondary domain name system (DNS) server
- **Shared** - whether this organization network is shared or not
- **Resource Pool Owner** - the resource pool associated with the network. Click this label to view the details of the resource pool.

### 2.8.1.2 Create Organization Network

Ensure that **Org Networks** permissions are on before creating an org network. Depending on the assigned permissions, you can create all types of org networks, or only certain org network type(s) - direct, routed, or isolated. For more information about permissions, refer to the **VMware Cloud Director Permissions** section of this guide.

1. Go to your Control Panel > **Cloud** > **Org Networks** menu.
2. On the following page, click ▶.
3. On the page that appears, fill in the organization network creation form:
- **Label** - specify a name for the organization network
- **Organization** - an organization to which the network will be connected (appears by default and can not be changed)
- **Resource Pool** - choose a resource pool to which the network will be connected
- **Network Type** - choose a type of the organization network. Depending on the type selected, the options will differ:

  Please note that for the NSX-T resource pool, the *Shared* option is not available when creating a direct, routed, or isolated org network.

**Direct**
- **External Network** - choose an external network from the drop-down list
- **Shared** - move the slider to the right to make this network shared

**Routed**
- **Shared** - move the slider to the right to make this network shared
- **Edge Gateway** - choose an edge gateway to which the network will be connected
- **Network Address** - specify a network address (CIDR address format with gateway address)
- **User Gateway DNS** - move the slider to the right if the selected edge gateway has configured DNS. Otherwise fill in **Primary DNS**, **Secondary DNS**, and **DNS Suffix** fields.
- **Primary DNS** - specify IP address of the primary domain name system (DNS) server
- **Secondary DNS** - specify IP address of the secondary domain name system (DNS) server
- **DNS Suffix** - specify DNS suffix
- **Static IP Pools** - specify start/end IP addresses. To add more than one line, click the + button

**Isolated**
- **Shared** - move the slider to the right to make this network shared
- **Primary DNS** - specify IP address of the primary domain name system (DNS) server
- **Secondary DNS** - specify IP address of the secondary domain name system (DNS) server
- **DNS Suffix** - specify DNS suffix
- **Static IP Pools** - specify start/end IP addresses. To add more than one line, click the + button

4. Click the **Submit** button.
2.8.1.3  Edit Organization Network

1. Go to your Control Panel > Cloud > Org Networks menu.
2. Click the Actions button next to the organization network you want to edit, then click Edit.
3. On the page that appears, edit the necessary parameters:
   - **Label** - specify a name for the organization network
   - **Shared** - move the slider to the right to make this network shared
   
   Please note that for the NSX-T resource pool, the Shared option is not available when editing a direct, routed, or isolated org network.

   - **Primary DNS** - specify IP address of the primary domain name system (DNS) server
   - **Secondary DNS** - specify IP address of the secondary domain name system (DNS) server
   - **DNS Suffix** - specify DNS suffix
     - **Start IP** - specify start IP address
     - **End IP** - specify end IP address
     Click the “+” button to add several IP pools.

4. Click the Submit button.

2.8.1.4  Delete Organization Network

1. Go to your Control Panel > Cloud > Org Networks menu.
2. The page that loads shows the list of VMware Cloud Director Organization networks.
3. Click the Actions button next to the network you want to delete, then click Delete. You will be asked for confirmation before the network is deleted.

2.8.2  NAT Rules

Information on this page applies only to non-advanced edge gateways. For information on how to manage NAT rules for advanced edge gateways, refer to NAT Rules for NSX Integration.

VMware Cloud Director NAT (Network Address Translation) service translates source or destination IP addresses and port numbers. In the most common case, you associate a NAT service with an uplink interface on an Edge Gateway so that addresses on organization VDC networks are not exposed on the external network.
You can view/create/edit/delete NAT rules using OnApp Control Panel.

This functionality is available for users with the vCloud Organization Administrator role.

### 2.8.2.1 View NAT Rules

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > Edge gateway's label > **Nat Service** tab.
2. On the page that appears, you will see the list of NAT rules together with their details:

   - **Rule type** - the type of the NAT rule (DNAT, SNAT)
   - **Network** - the name of VMware Cloud Director network
   - **Original IP** - the original IP address to apply this rule on
   - **Original port** - the port of original IP address
   - **Translated IP** - the IP address to translate the addresses of outgoing packets to
   - **Translated port** - the port of translated IP address
   - **Enabled** - whether this rule is enabled or not
   - **Protocol** - the type of protocol
   - **Actions** - processes which you can perform with the NAT rule

### 2.8.2.2 Create NAT Rules

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > edge gateway's label > **Nat Service** tab.
2. Click the **Add New Rule** button or "+" button.
3. On the page that appears specify the following parameters:
   - **Enabled** - tick the checkbox to enable this NAT rule
   - **Rule type** - choose the type of the NAT rule from the drop-down menu:
     - **SNAT** - source network address translation. This kind of rule translates the packet's source address and, optionally, source IP port to the values you specify.
     - **DNAT** - destination network address translation. This kind of rule translates the packet's destination address and, optionally, destination IP port to the values you specify.
   - **Network** - choose the VMware Cloud Director network from the drop-down menu
     - **Original IP** - specify the original IP address to apply this rule on
     - **Original port** - specify the port of original IP address (applies only for DNAT rule type)
     - **Translated IP** - specify the IP address to translate the addresses of outgoing packets
     - **Translated port** - specify the port of translated IP address (applies only for DNAT rule type)
     - **Protocol** - choose the type of protocol from the drop-down menu (applies only for DNAT rule type)
4. Click **Create**.

### 2.8.2.3 Edit NAT Rule

1. Go to your Control Panel > Cloud > Edge Gateways > edge gateway's label > Nat Service tab.
2. Click the Actions icon > **Edit** next to the NAT rule, which you want to edit.
3. On the page that appears change the following parameters:
   - **Enabled** - move the slider to the right to enable this NAT rule
   - **Network** - choose the VMware Cloud Director network from the drop-down menu
   - **Original IP** - specify the original IP address to apply this rule on
   - **Original port** - specify the port of original IP address (applies only for DNAT rule type)
   - **Translated IP** - specify the IP address to translate the addresses of outgoing packets
   - **Translated port** - specify the port of translated IP address (applies only for DNAT rule type)
   - **Protocol** - choose the type of protocol from the drop-down menu (applies only for DNAT rule type)
4. Click **Submit**.

### 2.8.2.4 Delete NAT Rules

1. Go to your Control Panel > Cloud > Edge Gateways menu > specific edge gateway's label > Nat Service tab.
2. Click the Delete icon next to the NAT rule you want to delete.
3. Confirm the deletion.

### 2.8.3 Firewall Rules

*Information on this page applies only to non-advanced edge gateways. For information on how to manage firewall for advanced edge gateways, refer to NSX Firewalls.*

*This functionality is available for users with the vCloud Organization Administrator role.*

#### 2.8.3.1 Create Firewall Rules

1. Go to your Control Panel > Cloud > Edge Gateways menu.
2. Click specific Edge Gateway's label.
3. Click the **Firewall Service** tab > **Firewall Rules**.
4. Click the **Add New Rule** button.
5. Set the following:
   - **Enabled** - whether the firewall rule is enabled or not.
   - **Description** - the description of the firewall rule.
   - **Command** - there are two commands:
     - **ACCEPT** – defines the packets that will be accepted by the firewall.
     - **DROP** – defines the packets that will be rejected by the firewall.
   - **Source** - the source IP address for which this firewall rule is active. This can be an IP address, CIDR, IP range, “any”, “internal” or “external”. This field is not case sensitive.
   - **Source port** - the source port for which this firewall rule is effective.
   - **Destination** - the destination IP address for which this firewall rule is active. This can be an IP address, CIDR, IP range, “any”, “internal” or “external”. This field is not case sensitive.
   - **Destination port** - the destination port for which this firewall rule is effective.
   - **Protocol** - there are several types of protocol - TCP, UDP, ICMP, TCP+UDP or any.
   - **Enable logging** - tick this check box to enable logging.

6. Click the **Create** button.

2.8.3.2 Edit Firewall Rules

1. Go to your Control Panel > **Cloud** > **Edge Gateways** menu.
2. Click specific Edge Gateway’s label.
3. Click the **Firewall Service** tab > **Firewall Rules**.
4. On the page that appears you will see the list of firewall rules. Click the **Edit** icon next to the firewall rule you want to edit.
5. Change the following settings:
   - **Enabled** - whether the firewall rule is enabled or not.
   - **Description** - the description of the firewall rule.
   - **Command** - there are two commands:
     - **ACCEPT** – defines the packets that will be accepted by the firewall.
     - **DROP** – defines the packets that will be rejected by the firewall.
   - **Source** - the source IP address for which this firewall rule is active. This can be an IP address, CIDR, IP range, “any”, “internal” or “external”. This field is not case sensitive.
   - **Source port** - the source port for which this firewall rule is effective.
   - **Destination** - the destination IP address for which this firewall rule is active. the destination IP address for which this firewall rule is active. This can be an IP address, CIDR, IP range, “any”, “internal” or “external”. This field is not case sensitive.
   - **Destination port** - the destination port for which this firewall rule is effective.
   - **Protocol** - there are several types of protocol - TCP, UDP, ICMP, TCP+UDP or any.
   - **Enable logging** - tick this check box to enable logging.

6. Click the **Save** button.
2.8.3.3 Delete Firewall Rules

1. Go to your Control Panel > **Cloud** > **Edge Gateways** menu.
2. Click specific Edge Gateway’s label.
3. Click the **Firewall Service** tab > **Firewall Rules**.
4. On the page that appears you can see the list of firewall rules. Click the **Delete** icon next to the firewall rule you want to delete. Confirm the deletion.

2.8.4 Cross VDC Networks

Cross virtual data center networking is introduced in vCloud Director 9.5. Cross-virtual data center networks enable organizations to group up to four virtual data centers and configure stretched layer 2 networks in each group. Cross-virtual data center networks are imported from VCD to OnApp CP both as a network zone and as an Org network within this zone. Importing cross-virtual data center networks as network zones enables administrators to configure billing for their usage.

On your Control Panel, you can create and manage cross VDC networks and use them to **deploy a vApp**. In this document, you can find information on how to manage cross VDC networks and network zones.

2.8.4.1 View Cross VDC Networks Imported as Network Zones

1. Go to your Control Panel > **Admin** > **Settings**.
2. Click the **Network Zones** icon. The screen that appears will show all network zones with the following details:
   - **Label** - the name of the network zone
   - **Zone type** - cross VDC networks belong to the **VPC Server Zone**
   - **Location group** - the location group with which the network zone is associated

To view the list of networks assigned to the zone, click the zone label.

2.8.4.2 View Cross VDC Networks Imported as Networks

1. Go to your Control Panel > **Admin** > **Settings**.
2. Click the **Networks** button and switch to the **Org** tab.
3. The screen that appears shows the list of all organization networks, including cross VDC networks with the following details:
   - **Label** - the name of the network
   - **Edge Gateway** - the edge gateway associated with the network
   - **Gateway Address** - the IP address of the gateway
   - **Network Mask** - the mask of the network
   - **Resource Pool Owner** - the resource pool associated with the network
User Group - the organization associated with the org network

When you click a cross VDC network label, you can see the following information:

1. 
   - Label - the name of the network
   - Status - the status of the network
   - Type - the type of the network that is Cross VDC
   - Edge Gateway - the edge gateway associated with the network
   - Gateway Address - the IP address of the gateway
   - Network Mask - the IP address of the network mask
   - Use gateway DNS - whether gateway DNS is applied to the network or not
   - Primary DNS - the IP address of the primary domain name system (DNS) server
   - Secondary DNS - the IP address of the secondary domain name system (DNS) server
   - Shared - whether this organization network is shared or not
   - Resource Pool Owner - the resource pool associated with the network
   - IP Nets - the list of available IP nets with the following details
     - IP Address - the list of IP addresses included into the IP Net
     - Assigned - the status that indicated whether IP addresses are assigned to VS
     - VS - the virtual servers to which IP addresses are assigned

2.8.4.3 Create Cross VDC Network

1. Go to your Control Panel > Cloud > Cross VDC Networks.
2. Click New Cross VDC Network and provide the following details:
   - Label - the name of the network
   - VDC Group - the group associated with the network
   - Gateway CIDR - the network Classless Inter-Domain Routing (CIDR) setting in the format network_gateway_IP_address/subnet_prefix_length
3. Click Create to apply the settings.

After you create the cross VDC network, a corresponding Org network is created that you can use to provision a vApp.

2.8.4.4 Edit Cross VDC Network

1. Go to your Control Panel > Cloud > Cross VDC Networks.
2. Click the Actions icon and click Edit.
3. You can edit a Label of the network.
4. Click Save to apply the settings.
2.8.4.5 Delete Cross VDC Network

1. Go to your Control Panel > Cloud > Cross VDC Networks.
2. Click the Actions icon and click Delete.
3. Click OK to confirm the deletion.

When you delete a cross VDC network, the corresponding Org network is also deleted.

- Buckets
- Org Networks

2.8.5 External Networks

External networks provide the interface to the Internet for virtual servers connected to external organization vDC networks. External networks are imported both as a network zone and as a network within that zone. Importing external networks as network zones enables administrators to configure billing for external network usage. Currently, you can only view external networks in OnApp.

2.8.5.1 View External Networks Imported as Network Zones

To view external networks imported as network zones into OnApp:
1. Go to your Control Panel > Admin > Settings menu.
2. Click the Network Zones icon. The screen that appears will show all network zones with the following details:
   - Label - the name of the zone
   - Location group - the location group with which the zone is associated

Click a zone's label (name) to see the list of networks assigned to it.

At Control Panel > Settings > Network Zones there is an Actions button next to the imported external networks which enables you to edit or delete networks. However, these changes are not synchronized with VMware Cloud Director. Therefore, it is not recommended to edit or delete imported external networks in OnApp.

2.8.5.2 View External Networks Imported as Networks

To view the external networks imported as networks into OnApp:
1. Go to your Control Panel > Admin > Settings menu.
2. Click the Networks button and select the External tab.
3. The screen that appears shows the list of imported external networks:
   - Label - the name of the network
   - Identifier - the identifier of the network
When you click a network label, you can see the following information:

**Details**
- **Label** - the name of the network
- **Identifier** - the identifier of the network
- **VLAN** - the VLAN number
- **Network Zone** - the network zone to which the network belongs

**IP Nets**
- **IP Address** - the list of IP addresses included in the IP Net together with the NSX-V edge gateway sub-allocated IPs
- **Assigned** - the status that indicated whether IP addresses are assigned to VS
- **VS** - the virtual servers to which IP addresses are assigned

### 2.8.6 VPN Services

Information on this page applies only to non-advanced edge gateways. For information on how to manage VPN for advanced edge gateways, refer to [NSX IPSec VPN](#) and [L2 VPN](#).

A VMware Cloud Director edge gateway configuration can define an IPsec virtual private networking (VPN) service to provide secure virtual private networking within an organization, between organization VDC networks, or between an organization VDC network and an external IP address.

VPN Service allows you to create VPN tunnels for current Edge Gateway using OnApp Control Panel.

- Ensure that **Tunnels** permissions are on before managing VPN tunnels. For more information about permissions refer to the [OnApp Permissions](#) section.
- This functionality is available for users with the vCloud Organization Administrator role.
2.8.6.1 View VPN Tunnels

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > edge gateway’s label > VPN Service tab.

2. On the page that appears, you will see the list of VPN tunnels together with their details:
   - **Name** - the label of the VPN tunnel
   - **Enabled** - whether VPN tunnel is enabled or not
   - **Description** - the description of the VPN tunnel
   - **Peer** - the ID for the peer end point
   - **Local** - the ID for local end point
   - **Local network** - the name of the local network in the VPN tunnel
   - **Peer network** - the name of the peer network in the VPN tunnel
   - **Operational** - whether this VPN tunnel is operational or not
   - **Actions** - processes which you can perform with the VPN tunnel

2.8.6.2 Create VPN Tunnel

1. Go to your Control Panel > **Cloud** > **Edge Gateways** menu > specific edge gateway’s label > VPN Service tab.

2. Click the "+" button.

3. On the page that appears, specify the following parameters:
   - **Name** - specify the label of the VPN tunnel
   - **Enabled** - move the slider to the right to enable this VPN tunnel
   - **Description** - provide the description of the VPN tunnel that can include no more than 255 characters
   - **Tunnel type** - select the type of the VPN tunnel
   - **Local Native Address** - specify the IP address of the local network
   - **Local Networks** - select one or several local networks from the drop-down list. Local networks are organization networks that are connected to the destination edge gateway.
   - **Peer ID** - specify the IP address of the peer endpoint. The Peer IP cannot be the same for multiple IPSec VPNs. Peer ID is used to uniquely identify the peer. If the peer address is on this or another organization VDC network, this should be peer’s native IP address. If peer is NAT’d, this should be the private peer IP address.
   - **Peer Behind NAT** - move the slider to the right to enable specifying peer native address
   - **Peer Native Address** - if Peer Behind NAT slider is enabled, enter IP address to reach the peer. If the Peer is NAT’d, this should be the public side address of NAT.
   - **PeerNetworks** - specify the peer network address. Peer Network cannot be the same as the local network. Network address should be written in CIDR format.
   - **Shared Secret Encrypted** - move the slider to the right to encrypt the shared secret
   - **Encryption Protocol** - specify the type of encryption protocol (default protocol is AES-236)
   - **Prehashed Key** - the key used for authentication. Shared secret key should be from 32 to 128 characters in length and have at least one uppercase letter, one lowercase letter and one number. Special characters are not allowed.
MTU - specify the size of maximum transmission unit (default value is 1500)

4. Click Create.

2.8.6.3 Delete VPN Tunnel
1. Go to your Control Panel > Cloud > Edge Gateways > edge gateway's label > VPN Service tab.
2. Click the Delete icon next to the VPN tunnel you want to delete.
3. Confirm the deletion.

2.9 NSX-V Integration
OnApp integration with VMware NSX-V Data Center delivers a complete L2-L7 networking and security virtualization platform providing you with agility and automation. This feature allows you to configure Advanced Edge services within the OnApp UI. Also, you receive access to full end-to-end provisioning instead of a limited one.

Requirements to use NSX-V with Cloud Director are the following:
- NSX-V integration must be enabled on your license. Please contact your Account Manager
- The version of Cloud Director should be 9.7 or higher
- It is a requirement to convert your edge gateways to advanced edge gateways after importing your environment to OnApp

In this chapter, you can find the following information on how to manage NSX-V integration with VMware Cloud Director:
- NSX Managers in OnApp
- Create and Manage NSX-V Edge Gateways
- NSX-V Firewalls
- NAT Rules for NSX-V Integration
- NSX-V Load Balancers
- NSX-V IPSec VPN
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **NSX-V L2 VPN**

### 2.9.1 NSX Managers in OnApp

The NSX manager is used to deploy a universal controller cluster that provides the control plane for the NSX-V environment. At OnApp, you can import NSX manager with limited functionality available and set vCloud credentials to gain access to full functionality. Once imported, it allows you to view and edit imported vCloud edge gateways in OnApp interface.

- This functionality is available for users with the vCloud Organization Administrator role.
- For vCloud, NSX-V Manager is enabled by default but you have to import and sync it with NSX-V edge first.
- Ensure that *Any action on NSX manager* permission is on before starting using NSX-V integration. For more information about permissions refer to the [Permissions] page.

#### 2.9.1.1 View NSX Manager Details

To view the details of a particular NSX manager:

1. Go to your Control Panel > Admin > Settings menu.
2. Click the SDN Managers icon, then click the vCenter/vCloud tab.
3. Click the label of an NSX manager to view its details:
   - **Label** - the name of the NSX manager
   - **Resource** - the hostname of the controller
   - **Type** - the type of manager, which is NSX (NSX-V)
   - **Version** - build and version number of NSX manager
   - **IP Address** - the IP address of the controller
   - **Uptime** - the time the NSX manager has been working and available
   - **Status** - powered on/off status of NSX manager

#### 2.9.1.2 Import NSX Manager to OnApp

Although NSX-V is enabled by default in OnApp, two steps are required to activate and start using this functionality. First, you need to set NSX-V credentials in order to communicate with NSX-V. Second, you need to import vCloud edge gateways to OnApp.

To import NSX manager to OnApp:

1. Go to your Control Panel > Admin > Settings menu.
2. Click the SDN Managers icon, then click the vCenter/vCloud tab.

3. Click the Actions button next to the NSX manager to view its options.

4. First, click Set credentials.

5. In the dialogue box that pops up, enter login and password.

6. Next, click the Import option.

   After the transaction is completed, all the NSX-V items will be imported to OnApp Control Panel. For instance, vCloud edge gateways will be available at Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.

7. Click the Save button.

   After NSX manager is successfully imported to OnApp interface, you can proceed to configuration of NSX-V firewalls and networks and start using edge gateways created at the vCloud side in OnApp interface.

See also:
- NSX-V Firewalls
- NAT Rules for NSX-V Integration
- NSX-V Load Balancers

2.9.2 Create and Manage NSX-V Edge Gateways

A VMware Cloud Director edge gateway is a virtual router for organization vDC (virtual Data Center) networks. NSX-V edge gateway provides a routed connection between an organization vDC network and an external network. Edge gateway can support up to ten interfaces. These interfaces are categorized as uplinks when they connect to an external network and internal interfaces when they connect to an organization vDC network.

You can create edge gateway in either a compact or a full configuration. The full configuration provides increased capacity and performance. The compact configuration requires less memory and fewer compute resources. All services are supported in either configuration.

2.9.2.1 View NSX-V Edge Gateways

1. Go to your Control Panel > Cloud > Edge Gateways menu > NSX-V.

2. The page that loads will show the list of VSs together with their:
   - Label - the name of the edge gateway
   - External address - external firewall IP
   - User group - the user group with which the edge gateway is associated
2.9.2.2 Create NSX-V Edge Gateway

1. Go to your Control Panel > Cloud > Edge Gateways menu > NSX-V tab and click the "+" button. This will start an edge gateway creation wizard.

2. Fill in the wizard step by step. Each of these steps is described in the corresponding sections below.

3. Click the New Edge Gateway button to start the creation process. You will be taken to the edge gateway details screen.

Step 1 of 6. General

1. Depending of the type of edge gateway, indicate some of the following details:
   - **Label** - indicate the label of the edge gateway
   - **Description** - write additional info about the edge gateway
   - **Organization** - select the organization with which the edge gateway will be associated
   - **Resource Pool** - choose the appropriate resource pool from the drop-down list
   - **Edge Gateway Configuration** - choose configuration type of the edge gateway from the drop-down list:
     - **Compact** - requires less memory and fewer compute resources
     - **Large** - provides increased capacity and performance compared to the Compact option
     - **Quad large** - recommended for high throughput and requires a high connection rate
   - **Enable High Availability** - move the slider to the right to enable high availability option for this edge gateway
   - **Create as Advanced Gateway** - move this slider to the right to enable advanced edge gateway services. Note that after you enable this slider, the **Enable Distributed Routing** slider becomes available to you.
• **Enable Distributed Routing** - move this slider to the right to enable distributed routing
• **Configure IP settings** - move this slider to the right to manually configure IP settings
• **Configure Rate Limits** - move this slider to the right to manually configure the inbound and outbound rate limits

2. Click **Next** to proceed to the following step of the wizard where you can specify the external networks.

### Step 2 of 6. External Networks
At this step, choose external networks to which your edge gateway will be connected:

• **External Networks** - select the external network from the drop-down list

Click **Next** to proceed to the following step of the wizard where you can specify the IP settings configuration.

### Step 3 of 6. Configure IP Settings
This step is optional. It becomes available after you move the **Configure IP settings** slider to the right at the first step of the creation wizard.

1. Click the label of the external network.

2. Indicate the following details:
   - **Assign** - move this slider to the right to assign an IP address for each of the subnets. You may choose not to assign IP addresses to a given subnet at all.
   - **Auto** - move this slider to the left to indicate the IP address manually.
   - **IP range** - select the IP range from the drop-down list
   - **IP address** - select the IP address from the drop-down list

3. Click **Next** to proceed to the following step of the wizard where you can specify the default gateway.

### Step 4 of 6. Default Gateway
At this step, select a network to be the default gateway:

• **Configure default gateway** - move this slider to the right to enable automatic configuration of the default gateway
• **Default gateway** - select the default gateway from the drop-down list
• **Use default gateway for DNS relay** - move this slider to the right to use default gateway for DNS relay

Click **Next** to proceed to the following step of the wizard where you can configure rate limits.

### Step 5 of 6. Configure Rate Limits
This step is optional. It becomes available after you move the *Configure rate limits* slider to the right at the first step of the creation wizard.

1. Click the label of the external network.

2. Indicate the following details:
   - *Enable rate limits* - move this slider to the right to enable the inbound and outbound rate limits
   - *Incoming rate limit* - indicate the inbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mbps.
   - *Outgoing rate limit* - indicate the outbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mbps.

3. Click *Next* to proceed to the next step of the wizard that completes the edge gateway creation process.

**Step 6 of 6. Summary**

At this step, you can find the configuration summary of the edge gateway, which will be created. You can view the external networks with their IP nets, IP addresses, incoming and outgoing rate limits.

The page that loads will provide you with the following information:

- *Label* - the label of the edge gateway
After you check all parameters, click **Submit** to start the creation process.

**2.9.2.3 View NSX-V Edge Gateway Details**

To view the details of a specific NSX-V edge gateway:

1. Go to your Control Panel > **Cloud** > **Edge Gateways** menu > NSX-V tab.
2. Choose the specific label. Click the **Overview** tab to see the following information:
   - **Label** - the name of the edge gateway
   - **Description** - additional info about the edge gateway
   - **Resource Pool** - the resource pool with which the edge gateway is associated
   - **Organization** - the organization with which the edge gateway is associated
   - **User Group** - the user group with which the edge gateway is associated
   - **Edge Gateway Configuration** - configuration type of the edge gateway
   - **High Availability** - whether high availability option is enabled for this edge gateway or not
   - **Use default route for dns relay** - whether default route for DNS relay is used or not
   - **IP Settings** section below includes the following columns:
     - **External network**
     - **IP net**
2.9.2.4 Edit NSX-V Edge Gateways

Whether you want to change an edge gateway or its components, be sure to select the corresponding action. If you want to edit an edge gateway choose the Edit action. For other components, select among such actions as Edit External Networks, Edit Default Gateway, Edit IP Settings or Edit Rate Limits.

To edit edge gateway:

1. Go to your Control Panel's Edge Gateways menu.
2. Click the Actions icon next to the edge gateway you want to edit, then choose the action from the list.
3. Edit the necessary parameters:

**Edit Edge Gateway**

1. 
   - **Label** - change the label of edge gateway
   - **Description** - specify additional info about edge gateway
   - **Edge Gateway Configuration** - this field cannot be edited, it is set during edge gateway creation
   - **High Availability** - tick the checkbox to enable high availability option for this edge gateway

**Edit External Networks**

Select the external network from the drop-down list

**Edit Default Gateway**

1.
   - **Configure default gateway** - move this slider to the left to enable automatic configuration of the default gateway
   - **Default gateway** - select the default gateway from the drop-down list
   - **Use default gateway for DNS relay** - move this slider to the right to use default gateway for DNS relay

**Edit IP Settings**

1.
   - **Participate** - move this slider to the right to assign IP address for each of the subnets. You may choose not to participate in a given subnet.
   - **Auto IP assignment** - move this slider to the left to indicate the IP address manually.
### 2.9.2.5 Delete NSX-V Edge Gateways

1. Go to your Control Panel > Cloud > Edge Gateways menu > NSX-V tab.
2. Click the Actions icon next to the edge gateway you want to remove, then choose Delete.
3. Confirm the deletion.

### 2.9.2.6 Advanced Edge Gateway Services

Starting with OnApp 5.4, you can manage advanced edge gateway services. You can check whether an edge gateway is advanced using Edge Gateways API requests (advanced edge gateway has the advanced_enabled parameter set to ‘true’). If your edge gateway is not advanced you can convert it to one as described in the section below.

Ensure that the Manage Advanced Edge Gateway Services permission is on before managing advanced edge gateway services. For more information, refer to the OnApp Permissions page of the Admin guide.

To manage advanced edge gateway services:

1. Go to your Control Panel > Cloud > Edge Gateways menu > NSX-V tab.
2. Choose the specific Edge Gateways' label. Click the Services tab. You will be redirected to the VMware Cloud Director where you can manage appropriate advanced edge gateway services. For more information, refer to the VMware Cloud Director documentation.

### 2.9.2.7 Convert Edge Gateways to Advanced Edge Gateways

To convert the non-advanced edge gateway into advanced:

1. Go to your Control Panel > Cloud > Edge Gateways menu > NSX-V tab.
2. Click the Actions icon next to the edge gateway you want to convert and then select Convert to Advanced Edge Gateway.

### 2.9.3 NSX-V Firewalls

NSX-V Firewall monitors the North-South traffic to provide perimeter security functionality including firewall, Network Address Translation (NAT), and site-to-site IPSec VPN functionality.
OnApp provides you with the possibility to manage NSX-V firewall service separately for each vCloud edge gateway in your cloud. It is possible to enable and disable firewall for the entire edge gateway or enable some of the rules on the list. You can configure the details of sources and destinations for each rule.

There are two major types of firewall rules in OnApp: internal (created on vCloud side and imported to OnApp) and user-defined (created on OnApp side).

NSX-V firewalls may be configured for an existing vCloud edge gateway. For more information on creation and import of the aforementioned instances, see the Create and Manage NSX-V Edge Gateways page.

2.9.3.1 Create NSX-V Firewall Rule
1. Go to your Control Panel > Cloud > NSX-V Edge Gateways menu.
2. In the NSX-V Edge Gateways tab click the label of the necessary Edge Gateway.
3. Click the Firewall tab to see the list of the firewall rules.
4. Click the button above the table. A new line will appear on the list.
5. In the line that appeared, specify the following parameters:
   - click to enable the rule.
   - Rule name - click to add the name of the rule.
   - Sources - as you hover over the Sources column space in the required line, the and buttons will appear:
     - Click the button to add a source IP address this firewall rule will be active for. This can be an IP address, CIDR, IP range, "any", "internal" or "external". This field is not case sensitive. Click the Apply IP button to save the changes.
     - Click the button to add the following types of destinations for this rule:
       - Network interfaces - select the necessary network interfaces from the list
       - Virtual machines - select the necessary virtual servers from the list
       - Networks - select the necessary networks from the list
       - IP sets - select the necessary options from the list of IP sets imported from vCloud side
       - Security groups - select the necessary options from the list of security groups imported from vCloud side
       Click the Apply rules button to save the changes.
     - The Toggle exclusion button appears only if there are any sources already added to the list. Click this button to exclude all the specified sources, so that the rule will accept as a source all possible options, except the ones you included. Once this option is enabled, the Any but tag appears before the list of sources.
6. Destinations - as you hover over the Destinations column space in the required line, the and buttons will appear:
▪ Click the button to add a destination IP addresses this firewall rule will be active for. This can be an IP address, CIDR, IP range, "any", "internal" or "external". This field is not case sensitive. Click the Apply IP button to save the changes.

▪ Click the button to configure the following types of destinations for this rule:
  - *Network interfaces* - select the necessary network interfaces from the list.
  - *Virtual machines* - select the necessary virtual servers from the list.
  - *Networks* - select the necessary networks from the list.
  - *IP sets* - select the necessary options from the list of IP sets imported from vCloud side.
  - *Security groups* - select the necessary options from the list of security groups imported from vCloud side.

Click the Apply rules button to save the changes.

▪ The **Toggle exclusion** button appears only if there are any destinations already added to the list. Click this button to exclude all the specified destinations, so that the rule will accept as a destination all possible options, except the ones you included. Once this option is enabled, the **Any but** tag appears before the list of destinations.

  o Services - click the button to open up a pop up window. Once it appears, specify the following values:
    ▪ **Protocol** - select TCP, UDP, ICMP, or Any.
    ▪ **Source port** - insert the source port (from 1 to 65535).
    ▪ **Destination port** - insert the destination port (from 1 to 65535).

If you don't specify any source, destination, or service value, it will be displayed as "any" by default.

1.

  o **ACCEPT** – click to specify that the traffic from or to the specified source(s), destination(s), and service(s) that will be accepted by the firewall.
  
  o **DENY** – click to specify that the traffic from or to the specified source(s), destination(s), and service(s) that will be denied by the firewall.
  
  o **Logging** - move the slider to the right to enable logging for this rule.

6. Click the **Save** button above the table to apply the changes.

- You may filter the rules in the list by name, source, destination, and service.
- To select all firewall rules on the list, hover over the top left corner of the table, and tick the checkbox that appears.
- To revert the last changes applied, click **Discard changes** below the table.
• To see the rules of the user-defined type only, click the icon above the table.
2.9.3.2 Edit NSX-V Firewall Rule

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Click specific NSX-V Edge Gateway’s label.
3. Click the Firewall tab.
4. On the page that appears, you will see the list of firewall rules for this edge gateway. Find the necessary rule and make the necessary changes in the corresponding line.

**Click to view the description of parameters available for editing.**

- **X** - click to enable the rule. If the rule is enabled, click the ✓ button to disable it.
- **Rule name** - click to change the name of the rule.
- **Sources** - as you hover over the Sources column space in the required line, the ➕, ✖️ and ✈️ buttons will appear:
  - Click the ➕ button to add a source IP address this firewall rule will be active for. This can be an IP address, CIDR, IP range, "any", "internal" or "external". This field is not case sensitive. Click the Apply IP button to save the changes.
  - Click the ✖️ button to configure the following types of destinations for this rule:
    - **Network interfaces** - select the necessary network interfaces from the list.
    - **Virtual machines** - select the necessary virtual servers from the list.
    - **Networks** - select the necessary networks from the list.
    - **IP sets** - select the necessary options from the list of IP sets imported from vCloud side.
    - **Security groups** - select the necessary options from the list of security groups imported from vCloud side. Click the Apply rules button to save the changes.
  - Click the ✈️ button to exclude all the sources except the ones added to the list. Once this option is enabled, the Any but tag appears before the list of sources.
• **Destinations** - as you hover over the **Destinations** column space in the required line, the ▶, ◐, and ▼ buttons will appear:
  
  - Click the ▶ button to add a destination IP addresses this firewall rule will be active for. This can be an IP address, CIDR, IP range, "any", "internal" or "external". This field is not case sensitive. Click the **Apply IP** button to save the changes.
  
  - Click the ◐ button to configure the following types of destinations for this rule:
    
    - **Network interfaces** - select the necessary network interfaces from the list.
    - **Virtual machines** - select the necessary virtual servers from the list.
    - **Networks** - select the necessary networks from the list.
    - **IP sets** - select the necessary options from the list of IP sets imported from vCloud side.
    - **Security groups** - select the necessary options from the list of security groups imported from vCloud side. Click the **Apply rules** button to save the changes.

  - The **Toggle exclusion** button appears only if there are any destinations already added to the list. Click this button to exclude all the destinations except the ones added to the list. Once this option is enabled, the **Any but** tag appears before the list of destinations.

• **Services** - click the ▼ button to open up a pop up window. Once it appears, specify the following values:
  
  - **Protocol** - select TCP, UDP, ICMP, or Any.
  - **Source port** - insert the source port (from 1 to 65535).
  - **Destination port** - insert the destination port (from 1 to 65535).

  If you don't specify any source, destination, or service value, it will be displayed as "any" by default.

  a. **ACCEPT** – click to specify that the traffic from or to the specified source(s), destination(s), and service(s) that will be accepted by the firewall.
  
  b. **DENY** – click to specify that the traffic from or to the specified source(s), destination(s), and service(s) that will be denied by the firewall.
  
  c. **Logging** - move the slider to the right to enable logging for this rule.

5. Click the **Save** button above the table to apply the changes.

2.9.3.3 Delete NSX-V Firewall Rule

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > **NSX-V Edge Gateways**.

2. Click specific NSX-V Edge Gateway’s label.
3. Click the **Firewall** tab.

4. On the page that appears, you will see the list of firewall rules. Select a rule from the list, and then click the **button above the table.

5. Click the **Save** button above the table to apply the changes.

### 2.9.4 NAT Rules for NSX-V Integration

VMware Cloud Director NAT (Network Address Translation) service translates source or destination IP addresses and port numbers. In the most common case, you associate a NAT service with an uplink interface on an Edge Gateway so that addresses on organization VDC networks are not exposed on the external network.

You can view/create/edit/delete NAT rules using OnApp Control Panel.

This functionality is available for users with the vCloud Organization Administrator role.

#### 2.9.4.1 Create NAT Rules

To add a new NAT rule for NSX-V integration:

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > **NSX-V** > NSX-V edge gateway’s label > **Nat Service** tab.

2. Click the "+" button.

3. On the page that appears specify the following parameters:

   For DNAT rules:
   - **Applied on** - select the VMware Cloud Director external network where the rule will be applied
   - **Protocol** - select the type of protocol (TCP, UDP, ICMP or Any)
   - **Original IP** - specify the original IP address to apply this rule on
   - **Original port** - specify the port of original IP address
   - **Translated IP** - specify the IP address to translate the addresses of outgoing packets to
   - **Translated port** - specify the port of translated IP address
   - **Description** - add description if any

   For SNAT rules:

   1. **Applied on** - select the VMware Cloud Director external network where the rule will be applied
      - **Original IP** - specify original IP address to apply this rule on and click the "?" icon to configure IP nets and IP ranges
      - **IP Net** - select an IP net from which the original IP address should be assigned
2.9.4.2 Edit NAT Rule

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways > NSX-V edge gateway's label > Nat Service tab.

2. Click the icon next to the NAT rule, which you want to edit.

3. On the page that appears change the following parameters:

   For DNAT rules:
   
   o Applied on - select the VMware Cloud Director external network where the rule will be applied
   o Protocol - select the type of protocol (TCP, UDP, ICMP or Any)
   o Original IP - specify the original IP address to apply this rule on
   o Original port - specify the port of original IP address
   o Translated IP - specify the IP address to translate the addresses of outgoing packets to
   o Translated port - the port of translated IP address
   o Description - add description if any

   For SNAT rules:

   1. Applied on - select the VMware Cloud Director external network where the rule will be applied
2.9.4.3 Delete NAT Rules

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways > edge gateway's label.

2. Click the Nat Service tab.

3. On the page that appears you will see the list of all NAT rules.

4. Select a rule from the list, and then click the button above the table.

5. Click the Save button to apply the changes.

2.9.5 NSX-V Load Balancers

The NSX-V Edge load balancer enables high-availability service and distributes the network traffic load among multiple servers. It distributes incoming service requests evenly among multiple servers in such a way that the load distribution is transparent to users. Load balancing thus helps in achieving optimal resource utilization, maximizing throughput, minimizing response time, and avoiding overload. NSX-V Edge provides load balancing up to Layer 7.

You map an external, or public, IP address to a set of internal servers for load balancing. The load balancer accepts TCP, UDP, HTTP, or HTTPS requests on the external IP address and
decides which internal server to use. Port 80 is the default port for HTTP and port 443 is the default port for HTTPs.

2.9.5.1 Before you begin

- You must have a working NSX-V Edge instance before you can configure load balancing. For information on setting up NSX-V Edge, see NSX-V Edge Configuration or Create and Manage NSX-V Edge Gateways.
- For information on configuring an NSX-V Edge certificate, see Certificate Authentication.
- Select the layer of load balancing (L7 or L4) by clicking on the Type selection icon in the top right corner of the screen.
- Select the level of logging from the Log level drop-box in the top right corner of the screen. Note that Emergency is the least detailed level of logging, and Debug is the most detailed level of logging.

2.9.5.2 Add Application Profiles

1. Go to your Control Panel > vCloud > NSX-V Edge Gateways > Edge gateway’s label > Load Balancers tab.
2. Select Application Profiles tab.
3. Click the "+" button on the top of the page.
4. On the page that appears, specify the following parameters:
   - Name - enter the name of the application profile
   - Type - select the type of traffic (TCP, HTTP, HTTPS or UDP). Depending on the type of traffic, specify the following parameters:

Click to view the list of parameters

For TCP or UDP

- Persistence - select the persistence type (Source IP, MSRDP or none)
- Expires - enter the persistence expiration time in seconds. The default value is 60 seconds.

For HTTP

- Persistence - select the persistence type (Source IP, Cookie or none)
- HTTP Redirect URL - enter the URL to which you want to redirect the HTTP traffic
- Mode - if you selected the Cookie persistence type, select the mode of inserting the cookie (insert, prefix or App session)
- Cookie name - if you selected the Cookie persistence type, enter the cookie name
- Expires - enter the persistence expiration time in seconds. The default value is 60 seconds.
- Insert X-Forwarded-For HTTP header - move the slider to the right to identify the originating IP address of a client connecting to a Web server through the load balancer

For HTTPS
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **Enable SSL Passthrough** - move the slider to the right to enable SSL passthrough.
- **HTTP Redirect URL** - enter the URL to which you want to redirect the HTTP traffic.
- **Persistence** - select the persistence type (Source IP, Cookie or none).
- **Mode** - if you selected the Cookie persistence type, select the mode of inserting the cookie (insert, prefix or App session).
- **Cookie name** - if you selected the Cookie persistence type, enter the cookie name.
- **Expires** - enter the persistence expiration time in seconds. The default value is 60 seconds.
- **Enable pool side SSL** - move the slider to the right to enable the HTTPS communication between the load balancer and the back-end servers.
- **Insert X-Forwarded-For HTTP header** - move the slider to the right to identify the originating IP address of a client connecting to a Web server through the load balancer.
- **Cipher** - enter a cipher algorithm.
- **Client Auth** - select whether to ignore or accept client authentication.
- **Virtual server certificates** - select server certificates, CA certificates and CRLs certificates to authenticate the load balancer from the server side.

5. Click the **Save** button.

---

2.9.5.3 Edit Application Profiles

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway’s label > Load Balancers tab.

2. Select Application Profiles tab.

3. Click the 📝 icon next to the application profile you want to edit.

4. On the page that loads, edit the following parameters:
   - **Name** - enter the name of the application profile
   - **Type** - select the type of traffic (TCP, HTTP, HTTPS or UDP). Depending on the type of traffic, specify the following parameters:

   **Click to view the list of parameters**
   
   For TCP or UDP
   
   - **Persistence** - select the persistence type (Source IP, MSRDp or none)
   - **Expires** - enter the persistence expiration time in seconds. The default value is 60 seconds.
For HTTP

- **Persistence** - select the persistence type (Source IP, Cookie or none)
- **HTTP Redirect URL** - enter the URL to which you want to redirect the HTTP traffic
- **Mode** - if you selected the Cookie persistence type, select the mode of inserting the cookie (insert, prefix or App session)
- **Cookie name** - if you selected the Cookie persistence type, enter the cookie name
- **Expires** - enter the persistence expiration time in seconds. The default value is 60 seconds.
- **Insert X-Forwarded-For HTTP header** - move the slider to the right to identify the originating IP address of a client connecting to a Web server through the load balancer

For HTTPS

- **Enable SSL Passthrough** - move the slider to the right to enable SSL passthrough
- **HTTP Redirect URL** - enter the URL to which you want to redirect the HTTP traffic
- **Persistence** - select the persistence type (Source IP, Cookie or none)
- **Mode** - if you selected the Cookie persistence type, select the mode of inserting the cookie (insert, prefix or App session)
- **Cookie name** - if you selected the Cookie persistence type, enter the cookie name
- **Expires** - enter the persistence expiration time in seconds. The default value is 60 seconds.
- **Enable pool side SSL** - move the slider to the right to enable the HTTPS communication between the load balancer and the back-end servers
- **Insert X-Forwarded-For HTTP header** - move the slider to the right to identify the originating IP address of a client connecting to a Web server through the load balancer
- **Cipher** - enter a cipher algorithm
- **Client Auth** - select whether to ignore or accept client authentication
- **Virtual server certificates** - select server certificates, CA certificates and CRLs certificates to authenticate the load balancer from the server side

5. Click the **Save** button.

2.9.5.4 Add Service Monitors

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway's label > Load Balancers tab.
2. Select Service Monitoring tab.
3. Click the "+" button on the top of the page.
4. On the page that appears specify the following parameters:
- **Name** - enter a name for the service monitor
- **Interval** - enter the interval in seconds in which a server is to be tested
- **Timeout** - the maximum time in seconds within which a response from the server must be received
- **Max retries** - enter the number of times the server is tested before it is declared DOWN
- **Method** - select the method to detect server status from the drop-down menu: GET, OPTIONS, or POST (GET, OPTIONS or POST)
- **URL** - Enter the URL to GET or POST (“/” by default).
- **Expected** - Enter the string that the monitor expects to match in the status line of HTTP response in the Expected section. This is a comma-separated list. For example, 200,301,302,401.
- **Send** - enter the string sent to the back-end server after a connection is established. The maximum permitted string length is 256 characters.
- **Receive** - enter the string to be matched. This string can be a header or in the body of the response. When the received string matches this definition, the server is considered UP.
- **Extension** - enter advanced monitor parameters as key=value pairs in the Extension section

5. Click the **Save** button.

---

**2.9.5.5 Edit Service Monitors**

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway's label > Load Balancers tab.

2. Select Service Monitoring tab.

3. Click the **Edit** icon next to the service monitor you want to edit.

4. On the page that loads, edit the following parameters:
   - **Name** - enter a name for the service monitor
   - **Interval** - enter the interval in seconds in which a server is to be tested
   - **Timeout** - the maximum time in seconds within which a response from the server must be received
Max retries - enter the number of times the server is tested before it is declared DOWN

Method - select the method to detect server status from the drop-down menu: GET, OPTIONS, or POST. (GET, OPTIONS or POST)

URL - enter the string that the monitor expects to match in the status line of HTTP response in the Expected section. This is a comma-separated list.

For example, 200,301,302,401.

Expected - enter the string that the monitor expects to match in the status line of HTTP response in the Expected section. This is a comma-separated list. For example, 200,301,302,401.

Send - enter the string sent to the back-end server after a connection is established. The maximum permitted string length is 256 characters.

Receive - enter the string to be matched. This string can be a header or in the body of the response. When the received string matches this definition, the server is considered UP.

Extension - enter advanced monitor parameters as key=value pairs in the Extension section.

5. Click the Save button.

2.9.5.6 Add Server Pools

To add server pools to manage load balancer distribution:

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway's label > Load Balancers tab.

2. Select Pools tab.

3. Click the "+" button on the top of the page.

4. On the page that appears specify the following parameters:

Name - enter a name of the server pool

Description - additional description if any

Monitor - select an existing default or custom monitor from the Monitors drop-down menu

Transparent - move the slider to the right to make client IP addresses visible to the back-end servers

Members - enter the name and IP address of the server member

- Weight - enter the proportion of traffic this member can handle

- Monitor port - enter the monitor port where the member is to receive health monitor pings

- Port - enter the port where the member is to receive traffic

- Min Conn. - enter the minimum number of concurrent connections that a member must always accept

- Max Conn. - enter the maximum number of concurrent connections that the member can handle. If the incoming requests go higher than the maximum, they are queued and wait for a connection to be released.

5. Click the Save button.
2.9.5.7 Edit Server Pools

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway's label > Load Balancers tab.

2. Select Pools tab.

3. Click the icon next to the service monitor you want to edit.

4. On the page that loads, edit the following parameters:
   - **Name** - enter a name of the server pool
   - **Description** - additional description if any
   - **Monitor** - select an existing default or custom monitor from the Monitors drop-down menu
   - **Transparent** - move the slider to the right to make client IP addresses visible to the back-end servers
   - **Members** - enter the name and IP address of the server member
     - **Weight** - enter the proportion of traffic this member can handle
     - **Monitor port** - enter the monitor port where the member is to receive health monitor pings
     - **Port** - enter the port where the member is to receive traffic
     - **Min Conn.** - enter the minimum number of concurrent connections that a member must always accept
     - **Max Conn.** - enter the maximum number of concurrent connections that the member can handle. If the incoming requests go higher than the maximum, they are queued and wait for a connection to be released.

5. Click the Save button.

2.9.5.8 Add Application Rules

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway's label > Load Balancers tab.

2. Select Application Rules tab.

3. Click the "+" button on the top of the page.

4. On the page that appears specify the following parameters:
   - **Name** - enter a name for an application rule
   - **Script** - Type the name and script for the rule. For information about the application rule syntax, see [http://cbonte.github.io/haproxy-dconv/](http://cbonte.github.io/haproxy-dconv/).
5. Click the **Save** button.

---

### 2.9.5.9 Edit Application Rules

1. Go to your Control Panel > **vCloud** > **Edge Gateways** > **NSX-V Edge Gateways** > Edge gateway's label > **Load Balancers** tab.

2. Select Application Rules tab.

3. Click the ![ ] icon next to the service monitor you want to edit.

4. On the page that loads, edit the following parameters:
   - **Name** - enter a name for an application rule
   - **Script** - type the name and script for the rule. For information about the application rule syntax, see [http://cbonte.github.io/haproxy-dconv/](http://cbonte.github.io/haproxy-dconv/).

5. Click the **Save** button.

---

### 2.9.5.10 Add Virtual Servers

To add an NSX-V Edge internal or uplink interface as a virtual server:

1. Go to your Control Panel > **vCloud** > **Edge Gateways** > **NSX-V Edge Gateways** > Edge gateway's label > **Load Balancers** tab.

2. Select Virtual Servers tab.

3. On the page that appears you will see the list of virtual servers together with their details:
   - **Name** - enter a name of a virtual server
   - **Application profile** - select application profile associated with this VS from the drop-down menu
   - **Enable virtual server** - move the slider to the right to make this virtual server available for use
   - **Enable acceleration** - move the slider to the right to enable acceleration for the load balancer to use the faster L4 load balancer engine rather than L7 load balancer engine
   - **Description** - add description if any
   - **IP Address** - enter an IP address that the load balancer is listening on
   - **Protocol** - select the protocol that the virtual server handles
   - **Port** - enter the port number that the load balancer listens on
   - **Default pool** - select the default VSSs pool
   - **Conn limit** - enter the maximum concurrent connections that the virtual server can process
   - **Conn rate limit** - enter the maximum incoming new connection requests per second section
   - **Selected rules** - add the application rule to associate it with the virtual server

4. Click the **Save** button.
2.9.5.11 Edit Virtual Servers

1. Go to your Control Panel > vCloud > Edge Gateways > NSX-V Edge Gateways > Edge gateway's label > Load Balancers tab.

2. Select Virtual Servers tab.

3. On the page that appears, edit the following parameters:
   - **Name** - enter a name of a virtual server
   - **Application profile** - select application profile associated with this VS from the drop-down menu
   - **Enable virtual server** - move the slider to the right to make this virtual server available for use
   - **Enable acceleration** - move the slider to the right to enable acceleration for the load balancer to use the faster L4 load balancer engine rather than L7 load balancer engine
   - **Description** - add description if any
   - **IP Address** - enter an IP address that the load balancer is listening on
   - **Protocol** - select the protocol that the virtual server handles
   - **Port** - enter the port number that the load balancer listens on
   - **Default pool** - select the default VSs pool
   - **Conn limit** - enter the maximum concurrent connections that the virtual server can process
   - **Conn rate limit** - enter the maximum incoming new connection requests per second section
   - **Selected rules** - add the application rule to associate it with the virtual server

4. Click the **Save** button.
2.9.6 NSX-V IPSec VPN

Internet Protocol Security (IPSec) VPN ensures secure and private communications over Internet Protocol (IP) networks. It authenticates and encrypts IP packets between two end points. A site-to-site VPN allows offices in multiple fixed locations to establish secure connections with each other over a public network such as the internet. Site-to-site VPN extends the company’s network, making computer resources from one location available to employees at other locations. The goal is to securely connect two or more LAN networks and allow full communication between them, without any restrictions.

2.9.6.1 Manage IPSec VPN Service

To manage IPSec VPN service for a specific edge gateway:

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Click the label of the necessary NSX-V edge gateway from the list of all NSX-V gateways in your cloud.
3. Go to the IPSec VPN tab.
4. You can manage the following options for the entire service for a specific edge:
   - Service status - move the slider to the right to enable IPSec VPN service for this edge gateway
   - Global shared key - the global pre-shared key (PSK) that is shared by all the sites whose peer endpoint is set to Any
     
     If a global PSK is already set, changing the PSK to an empty value and saving it has no effect on the existing setting.

     - click to edit the global shared key
     - click to preview the global shared key
     - Log level - select one of the following options, where Emergency is the least detailed level of logging, and Debug is the most detailed level of logging

2.9.6.2 Add IPSec VPN Site

OnApp IPSec VPN has two different session types: policy-based and route-based. With the policy-based IPSec VPN session type, you can connect multiple local subnets behind the NSX-V Edge with the peer subnets on the remote VPN site by using IPSec tunnels. Alternatively, if you select the route-based IPSec VPN session type, virtual tunnel interfaces (VTI) are created on the ESG appliance. Each VTI is associated with an IPSec tunnel. The encrypted traffic is routed from one site to another site through the VTI interfaces. IPSec processing happens only at the VTI interfaces.

To add an IPSec VPN site:

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Select the necessary NSX-V edge gateway from the list of all NSX-V gateways in your cloud.

3. Go to the **IPSec VPN** tab > click the **IPSec VPN sites** tab below.

4. Click the button above the table.

5. In the window that appears, specify the following parameters:

   - **Name** - specify the name of the IPSec VPN site
   - **Enabled** - move the slider to the right to enable this IPSec VPN site
   - **Enabled PFS** - move the slider to the right to enable Perfect Forward Secrecy for this site
   - **Local ID** - enter the local ID to identify the local NSX-V edge instance. This local ID is the peer ID on the remote site. Preferably, use the public IP address of the VPN or a fully qualified domain name (FQDN) for the VPN service as the local ID.
   - **Local Endpoint** - enter an IP address or an FQDN of the local endpoint. If you are adding an IP-to-IP tunnel using a pre-shared key, the local ID and local endpoint IP can be the same.
   - **Local subnets** - enter the subnets to share between the IPSec VPN sites in the CIDR format. Use a comma separator to enter multiple subnets

   The local subnets behind an NSX-V edge must have address ranges that do not overlap with the IP addresses on the peer VPN site. If the local and remote peer across an IPsec VPN tunnel have overlapping IP addresses, traffic forwarding across the tunnel might not be consistent.

   - **Peer ID** - enter the Peer ID to identify the peer site:
     - For peers using certificate authentication, this ID must be the distinguished name (DN) in the peer’s certificate. Enter the DN of the certificate as a range of comma-separated values in the following order without spaces: C=xxx,ST=xxx,L=xxx,O=xxx,OU=xxx,CN=xxx,E=xxx.
     - For PSK peers, the peer ID can be any text value. Preferably, use the public IP address of the VPN or an FQDN for the VPN service as the peer ID.
   - **Peer endpoint** - enter an IP address or an FQDN of the peer endpoint. The default value is any. If you retain the default value, you must configure the Global PSK.
   - **Peer subnet** - enter the internal IP address of the peer subnet in the CIDR format. Use a comma separator to type multiple subnets.
   - **Encryption algorithm** - select one of the following supported encryption algorithms from the dropbox:
     - AES (AES128-CBC)
     - AES256 (AES256-CBC)
     - Triple DES (3DES192-CBC)
     - AES-GCM (AES128-GCM)
   - **Authentication** - select one of the following options:
     - **PSK (Pre Shared Key)** - indicates that the secret key shared between NSX-V edge and the peer site is to be used for authentication. The secret key can be a string with a maximum length of 128 bytes. PSK authentication is disabled in FIPS mode.
- **Certificate** - indicates that the certificate defined at the global level is to be used for authentication.

- **Shared key** - the global pre-shared key (PSK) is shared by all the sites whose peer endpoint is set to ‘any’. If a global PSK is already set, changing the PSK to an empty value and saving it has no effect on the existing setting.

- **Diffie-Hellman Group** - select one of the following cryptography schemes that allows the peer site and the NSX-V edge to establish a shared secret over an insecure communications channel:
  - DH-2 (not available when the FIPS mode is enabled)
  - DH-5 (not available when the FIPS mode is enabled)
  - DH-14 (a default selection for both FIPS and non-FIPS mode)
  - DH-15
  - DH-16

- **Extension** - type one of the following:
  - `securelocaltrafficbyip=IPAddress` to redirect Edge local traffic over the IPSec VPN tunnel. IP address is the default value.
  - `passthroughSubnets=PeerSubnetIPAddress` to support overlapping subnets.

- **Digest Algorithm** - select one of the following secure hashing algorithms:
  - SHA1
  - SHA_256

- **IKE Option** - select one of the following Internet Key Exchange (IKE) protocols to set up a security association (SA) in the IPSec protocol suite:
  - **IKEv1** - when you select this option, IPSec VPN initiates and responds to IKEv1 protocol only
  - **IKEv2** - when you select this option, IPSec VPN initiates and responds to IKEv2 protocol only
  - **IKE-Flex** - when you select this option, and if the tunnel establishment fails with IKEv2 protocol, the source site does not fall back and initiate a connection with the IKEv1 protocol. Instead, if the remote site initiates a connection with the IKEv1 protocol, then the connection is accepted.

If you configure multiple sites with the same local and remote endpoints, make sure that you select the same IKE version and PSK across all these IPSec VPN sites.

- **IKE Responder Only** - move the slider to the right to operate IPSec VPN in a responder-only mode. In this mode, IPSec VPN never initiates a connection.

- **Session Type** - select one of the possible options:
  - **policy based** - select to use the policy-based IPSec VPN
  - **route-based** - select to use the route-based IPSec VPN. If you select this session type, fill in the following additional fields that will appear:
    - **Tunnel Interface IP CIDR**
    - **Tunnel Interface MTU** - default value is 1476. Valid values are in the range from 92 to 8976

4. Click the **Save** button above the table to apply the changes.
2.9.6.3 Edit IPSec VPN Site

To edit the details of an IPSec VPN site:

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways.
2. Select the necessary NSX-V edge gateway from the list of all NSX-V gateways in your cloud.
3. Go to the IPSec VPN tab > click the IPSec VPN sites tab below.
4. Click the 🖍 icon next to the required IPSec VPN site.
5. Make the necessary changes in the window that appears.

Click here to view the description of parameters available for editing.

- **Name** - specify the name of the IPSec VPN site
- **Enabled** - move the slider to the right to enable this IPSec VPN site
- **Enabled PFS** - move the slider to the right to enable Perfect Forward Secrecy for this site
- **Local ID** - enter the local ID to identify the local NSX-V edge instance. This local ID is the peer ID on the remote site. Preferably, use the public IP address of the VPN or a fully qualified domain name (FQDN) for the VPN service as the local ID.
- **Local Endpoint** - enter an IP address or an FQDN of the local endpoint. If you are adding an IP-to-IP tunnel using a pre-shared key, the local ID and local endpoint IP can be the same.
- **Local subnets** - enter the subnets to share between the IPSec VPN sites in the CIDR format. Use a comma separator to enter multiple subnets.
- **Peer ID** - enter the Peer ID to identify the peer site:
  - For peers using certificate authentication, this ID must be the distinguished name (DN) in the peer's certificate. Enter the DN of the certificate as a range of comma-separated values in the following order without spaces:
    \[C=xxx,ST=xxx,L=xxx,O=xxx,OU=xxx,CN=xxx,E=xxx.\]
For PSK peers, the peer ID can be any text value. Preferably, use the public IP address of the VPN or an FQDN for the VPN service as the peer ID.

- **Peer endpoint** - enter an IP address or an FQDN of the peer endpoint. The default value is **any**. If you retain the default value, you must configure the Global PSK.

- **Peer subnet** - enter the internal IP address of the peer subnet in the CIDR format. Use a comma separator to type multiple subnets.

- **Encryption algorithm** - select one of the following supported encryption algorithms from the dropbox:
  - AES (AES128-CBC)
  - AES256 (AES256-CBC)
  - Triple DES (3DES192-CBC)
  - AES-GCM (AES128-GCM)

- **Authentication** - select one of the following options:
  - **PSK (Pre Shared Key)** - indicates that the secret key shared between NSX-V Edge and the peer site is to be used for authentication. The secret key can be a string with a maximum length of 128 bytes. PSK authentication is disabled in FIPS mode.
  - **Certificate** - indicates that the certificate defined at the global level is to be used for authentication.

- **Shared key** - the global pre-shared key (PSK) is shared by all the sites whose peer endpoint is set to 'any'. If a global PSK is already set, changing the PSK to an empty value and saving it has no effect on the existing setting.

- **Diffie-Hellman Group** - select one of the following cryptography schemes that allows the peer site and the NSX-V Edge to establish a shared secret over an insecure communications channel:
  - **DH-2** (not available when the FIPS mode is enabled)
  - **DH-5** (not available when the FIPS mode is enabled)
  - **DH-14** (a default selection for both FIPS and non-FIPs mode)
  - **DH-15**
  - **DH-16**

- **Extension** - type one of the following:
  - `securelocaltrafficbyip=IPAddress` to redirect Edge local traffic over the IPSec VPN tunnel. IP address is the default value.
  - `passthroughSubnets=PeerSubnetIPAddress` to support overlapping subnets.

- **Digest Algorithm** - select one of the following secure hashing algorithms:
  - SHA1
  - SHA_256

- **IKE Option** - select one of the following Internet Key Exchange (IKE) protocols to set up a security association (SA) in the IPSec protocol suite:
  - **IKEv1** - when you select this option, IPSec VPN initiates and responds to IKEv1 protocol only.
  - **IKEv2** - when you select this option, IPSec VPN initiates and responds to IKEv2 protocol only.
  - **IKE-Flex** - when you select this option, and if the tunnel establishment fails with IKEv2 protocol, the source site does not fall back and initiate a connection with the
IKEv1 protocol. Instead, if the remote site initiates a connection with the IKEv1 protocol, then the connection is accepted.

If you configure multiple sites with the same local and remote endpoints, make sure that you select the same IKE version and PSK across all these IPSec VPN sites.

- **IKE Responder Only** - move the slider to the right to operate IPSec VPN in a responder-only mode. In this mode, IPSec VPN never initiates a connection.
- **Session Type** - select one of the possible options:
  - policy based - select to use the policy-based IPSec VPN
  - route-based - select to use the route-based IPSec VPN. If you select this session type, the following additional fields will appear:
    - **Tunnel Interface IP CIDR**
    - **Tunnel Interface MTU** - default value is 1476. Valid values are in the range from 92 to 8976

6. Click the **Save** button above the table to apply the changes.

### 2.9.6.4 Certificate Authentication

If you select Certificate as an Authentication option for an IPSec VPN site, it is required to enable **Certificate Authentication**. It is not possible to upload a certificate on OnApp side; the certificates are imported to OnApp from vCloud as you import the edge gateway (if there were any certificates assigned on the vCloud side).

**Self-signed certificates cannot be used for IPSec VPN.**

To configure certificate authentication for IPSec VPN:

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > **NSX-V Edge Gateways**.
2. Select the necessary NSX-V edge gateway from the list of all NSX-V gateways in your cloud.
3. Go to the **IPSec VPN** tab.
4. Move the **Enable Certificate Authentication** slider to the right to enable service authentication.
5. On the page that appears, select the necessary service certificates, CA certificates and CRLs certificates.

### 2.9.6.5 Delete IPSec VPN Site

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > **NSX-V Edge Gateways**.
2. Click the label of the NSX-V edge gateway the necessary IPSec VPN was added to.
3. Click the **IPSec VPN** tab.
4. Click the **IPSec VPN sites** tab below. On the page that appears, you will see the list of IPSec VPN sites added to this NSX-V edge gateway.
5. Click the line with the required IPSec VPN site to select it.

6. Once selected, click the button that appeared above the table to delete the IPSec VPN site.

7. Click the Save button above the table to apply the changes.

### 2.9.7 NSX-V L2 VPN

With L2 VPN, you can stretch multiple logical networks (both VLAN and VXLAN) between different physical sites. In addition, you can configure multiple sites on an L2 VPN server. L2 VPN allows you to extend your datacenter by allowing virtual machines to retain network connectivity across geographical boundaries. Virtual servers remain on the same subnet when they are moved between sites and their IP addresses do not change.

NSX-V L2 VPN configuration consists of three steps:

1. Configuration of your destination edge - L2 VPN server
2. Adding peer sites to the L2 VPN server
3. Configuration of your source edge - L2 VPN client

Before you proceed further, please note that:

- The Any action on L2 VPN service and Any action on L2 VPN peer site permissions should be enabled for a user who wants to use NSX-V L2 VPN.
- You must enable the L2 VPN service on both the server and the client. For that, use the L2 VPN slider located at the top left corner of the screen.

#### 2.9.7.1 Edit L2 VPN Server

Configure L2 VPN Server which is the destination NSX-V edge to which the client is to be connected.

To configure L2 VPN server:

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Click the label of the NSX-V edge gateway for which you want to configure the server.
3. Click the L2 VPN tab, then click Server > Server Global tab.
4. On the page that follows edit the following fields:
   - Listener IP - enter the primary or secondary IP address of an external interface of the NSX-V edge
   - Listener Port - edit the port number for the L2 VPN service
   - Encryption algorithm - select one or more encryption algorithms to encrypt the communication between the server and the client
2.9.7.2 Add Peer Sites to L2 VPN Server

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Click the label of the NSX-V edge gateway for which you want to configure the server.
3. Click the L2 VPN tab, then click Server > Server Sites tab.
4. On the page that follows, edit the following details:
   - **Name** - enter a unique name for the peer site
   - **Enabled** - move the slider to the left to disable the newly added peer site
   - **Description** - add a description of your peer site
   - **User ID** - enter a user name with which the peer site is to be authenticated
   - **User password** - enter a password with which the peer site is to be authenticated
   - **Confirm password** - confirm the password
   - **Select sub-interaces** - select the sub interfaces to be stretched with the client
   - **Egress optimization gateway address** - enter the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel. Can be used if the default gateway for virtual servers is the same across the two sites. Provide the list of IP addresses separated by comma, e.g. 191.1.1.1, 192.1.1.1
5. Click the **Save** button.
2.9.7.3 Edit Peer Sites
1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Click the label of the NSX-V edge gateway for which you want to configure the server.
3. Click the L2 VPN tab, then click Server > Server Sites tab.
4. Click the icon next to the label of the peer site you want to edit.
5. On the page that loads, edit the following details:
   - **Name** - enter a unique name for the peer site
   - **Enabled** - move the slider to the left to disable the newly added peer site
   - **Description** - add a description of your peer site
   - **User ID** - enter a user name with which the peer site is to be authenticated
   - **User password** - enter a password with which the peer site is to be authenticated
   - **Confirm password** - confirm the password
   - **Select sub-interfaces** - select the sub interfaces to be stretched with the client
   - **Egress optimization gateway address** - enter the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel
6. Click the **Save** button.

Next, proceed to L2 VPN Client which is the source NSX-V edge to which the client is connected.

2.9.7.4 Edit L2 VPN Client
1. Go to your Control Panel > Cloud > Edge Gateways > NSX-V Edge Gateways tab.
2. Click the label of the NSX-V edge gateway for which you want to configure the server.
3. Click the L2 VPN tab, then click Client > Client Global tab.
4. On the page that loads, edit the following details:
   - **Server address** - enter the address of the L2 VPN server to which this client is to be connected
   - **Server port** - edit the default port to which the L2 VPN client must connect to, if necessary
   - **Encryption algorithm** - select the encryption algorithm for communicating with the server
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

- **Select sub-interfaces** - to select the sub interfaces to be stretched to the server
- **Egress optimization gateway address** - enter the gateway IP address of the sub interfaces or the IP addresses to which traffic should not flow over the tunnel
- **User ID** - enter a user name with which the server is to be authenticated
- **User password** - enter a password with which the peer site is to be authenticated
- **Confirm password** - confirm the password

5. Click the **Save** button at the top of the page.

### 2.9.7.5 Edit Advanced Client Settings

When a client edge does not have direct access to the Internet and must reach the source (server) NSX-V edge through a proxy server, you must specify proxy server settings as follows:

1. Go to your Control Panel > **Cloud** > **Edge Gateways** > **NSX-V Edge Gateways** menu.
2. Click the label of the NSX-V edge gateway for which you want to configure the server.
3. Click the **L2 VPN** tab, then click **Client > Client Advanced** tab.
4. On the page that loads, edit the following details:
   - **Enable secure proxy** - move the slider to the right to enable only secure proxy connections
     - **Proxy address** - enter the proxy server address
     - **Proxy port** - enter the proxy server port
     - **Proxy user name** - enter a user name with which the proxy server is to be authenticated
     - **Proxy user password** - enter a password with which the proxy server is to be authenticated
   - **Use system generated certificate** - move the slider to the right to use system generated certificate

5. Click the **Save** button at the top of the page.

2.10 NSX-T Integration

There are two types of NSX software-defined networking platforms — NSX-V and NSX-T.

NSX-T was created for different virtualization platforms and multi-hypervisor environments. NSX-V (for vSphere) supports SDN for only VMware vSphere, NSX-T supports network virtualization stack for KVM, Docker, Kubernetes, and OpenStack as well as AWS native workloads. NSX-T can be deployed without a vCenter Server and is adopted for heterogeneous compute systems.

In this chapter, you can find the following information on how to manage NSX-T integration with VMware Cloud Director:

- Create and Manage NSX-T Edge Gateways
- NSX-T Firewall Rules
- NSX-T NAT Rules

2.10.1 Create and Manage NSX-T Edge Gateways

NSX-T edge gateways provide routing services and connectivity to networks that are external to the NSX-T deployment. On this page, you will find information on how to create and manage NSX-T edge gateways.

2.10.1.1 View NSX-T Edge Gateways

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-T tab.

2. The page that loads will show the list of NSX-T edge gateways together with their:
   - Label - the name of the edge gateway
   - User group - the user group with which the edge gateway is associated
   - Organization - the organization with which the edge gateway is associated
   - Resource pool - the resource pool with which the edge gateway is associated
2.10.1.2 Create NSX-T Edge Gateway

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-T and click the "+" button above the table or New NSX-T Edge Gateway below. This will start an edge gateway creation wizard.

2. Fill in the wizard step by step. Each of these steps is described in the corresponding sections below.

3. Click the New Edge Gateway button to start the creation process. You will be taken to the edge gateway details screen.

2.10.1.2.1 Step 1 of 4. General

1. Fill in the following details:
   - **Label** - indicate the label of the edge gateway
   - **Description** - write additional info about the edge gateway
   - **Enable distributed routing** - select the check box to enable distributed routing
   - **Organization** - select the organization with which the edge gateway will be associated from the drop-down list
   - **Resource Pool** - select the appropriate resource pool from the drop-down list

2. Click **Next** to proceed to the following step of the wizard where you can specify the external networks.

2.10.1.2.2 Step 2 of 4. External Networks

At this step, choose external networks to which your edge gateway will be connected:

**External Networks** - select the external network from the drop-down list

Click **Next** to proceed to the following step of the wizard where you can specify the IP settings configuration.

2.10.1.2.3 Step 3 of 4. Allocated IPs

1. Fill in the following details:
   - **Assign Primary IP Automatically** - move the slider to the left to assign the public IP address of an edge gateway manually otherwise, it will be assigned automatically
   - **Configure Sub-allocated IPs** - move the slider to the right if you want to configure the sub-allocated IPs
   - **Primary IP** - enter the public IP address of edge gateway if you want to configure it manually
     - **Allocate IP range** - allocated IP addresses of an external network to an edge gateway, where:
       - **Start address** - the start of the IP addresses range
       - **End address** - the end of the IP addresses range
     - Click to add an additional row with the allocated IP range

2. Click **Next** to proceed to the following step of the wizard where you can specify the external networks.

2.10.1.2.4 Step 4 of 4. Summary

At this step, you can find the configuration summary of the edge gateway, which will be created. You can view the external networks with their IP nets, IP addresses, incoming and outgoing rate limits.

The page that loads will provide you with the following information:
Label - the label of the edge gateway
Description - additional info about the edge gateway

Enable distributed routing - ✓ if distributed routing is enabled, otherwise ✗
Organization - the organization with which the edge gateway will be associated with
Resource Pool - the resource pool with which the edge gateway is associated
External Network - the external networks to which your edge gateway is connected
Allocated IPs - allocated IP addresses of an external network to an edge gateway

After you check all parameters, click Submit to start the creation process.

2.10.1.3 Edit NSX-T Edge Gateway
To edit the details of an edge gateway, click the Actions icon next to the one you want to edit. On the page that loads, you can change the following:

- Label - the label of the edge gateway
- Description - additional info about the edge gateway

Click Submit to save the changes.

2.10.1.4 Delete NSX-T Edge Gateways
1. Go to your Control Panel > Cloud > Edge Gateways > NSX-T tab.
2. Click the Actions icon next to the edge gateway you want to remove, then choose Delete.
3. Confirm the deletion.

2.10.1.5 NSX-T Edge Gateway Services
You can access the NSX-T edge gateway services in VMware Cloud Director via OnApp Control Panel.

To access the VCD environment automatically, you should be authenticated in the browser.

To manage NSX-T edge gateway services:
1. Go to your Control Panel > Cloud > Edge Gateways menu > NSX-T tab.
2. Click the label of the necessary NSX-T edge gateway. Then click the Services tab. You will be redirected to the VMware Cloud Director where you can manage appropriate NSX-T edge gateway services. For more information, refer to the VMware Cloud Director documentation.

2.10.2 NSX-T Firewall Rules
NSX-T firewall is a set of customizable rules, which protect the system against network threats. NSX-T firewall rules are completely synchronized with the vCloud, so regardless of the side from where you are updating the firewalls, all updates are visible on your OnApp Control Panel.

In OnApp, you can manage the firewall rule separately for each NSX-T edge gateway in your cloud. You can also configure the details of sources and destinations for each rule.

At this point we support only firewall rules with IPv4 type.
2.10.2.1 Create NSX-T Firewall Rule

1. Go to your Control Panel > Cloud > Edge Gateways menu.

2. Select the NSX-T tab.

3. Click the label of the necessary NSX-T edge gateway.

4. Click the Firewall Rules tab to see the list of the firewall rules.

5. Click above the table. A new row will appear in the table of firewall rules with the default data. You can add the desired amount of rows by clicking .

6. Hover over the row that appeared and specify the following parameters:
   
   o **Label** – name of the rule.
   
   o **Sources** – click  to add security groups and IP sets imported from the vCloud side. Select the necessary options from the list. Click

   
   to add a new group of source IP addresses this firewall rule will be active for. This can be an IP address, CIDR, or IP range.
   
   o **Destinations** – click  to add security groups and IP sets imported from the vCloud side. Click

   
   to add a new group of destination IP addresses this firewall rule will be active for. This can be an IP address, CIDR, or IP range.
   
   o **Applications** – click , then select the needed application port profiles.

   If you don't specify any source, application, or destination value, it will be displayed as "Any" by default.

1.

   o **Directions** – the options are In, Out, and In/Out. The default is In/Out. This field refers to the direction of traffic from the point of view of the destination object. In means that only traffic to the object is checked, Out means that only traffic from the object is checked, and In/Out means traffic in both directions is checked. Click to specify that the traffic from or to the specified source(s), destination(s), and service(s) will be accepted by the firewall. Click Save to save the changes.
   
   o **Actions** – the action applied by the rule can be Accept or Deny. The default is Accept. Click to specify that the traffic from or to the specified source(s), destination(s), and service(s) will be allowed by the firewall.
   
   o **Logging** – move the slider to the right to enable logging for this rule.

6. Click Save below the table to apply the changes.

   - To select all firewall rules on the list, hover over the top left corner of the table, and tick the checkbox that appears.
   
   - To revert the last changes applied, click Discard Changes below the table.
To see only the enabled rules, move the **Only Enabled** slider above the table to the right.

### 2.10.2.2 Edit NSX-T Firewall Rule
1. Go to your Control Panel > **Cloud** > **Edge Gateways** menu > **NSX-T** tab.
2. Click the label of the necessary NSX-T edge gateway.
3. Click the **Firewall Rules** tab to see the list of the firewall rules. Find the necessary rule and make the necessary changes in the corresponding row.

**Click to view the description of parameters available for editing.**

- **Status** – move the slider on the Status column to the right to enable the rule. If the rule is enabled, move the slider to the left to disable it.
- **Label** – click to change the name of the rule.
- **Sources** - as you hover over the required row, the **+** button will appear:
  - Click **+** to add IP sets and security groups imported from the vCloud side. Select the necessary options from the list.
  - Click **+** to create a new source IP set this firewall rule will be active for. This can be an IP address, CIDR, or IP range.
  - Click **-** near a source if you want to remove it.

- **Destinations** - as you hover over the required row, the **+** button will appear:
  - Click **+** to configure the IP sets and security groups imported from vCloud side for this rule. Select the necessary options from the list.
  - Click **+** to create a destination IP set this firewall rule will be active for. This can be an IP address, CIDR, or IP range.
  - Click **-** near a destination if you want to remove it.
Applications - as you hover over the required row, the button will appear:

- Click to configure the application port profiles for this rule. Select the necessary options from the list.
- Click near an application port profile if you want to remove it.

Click Save to save the changes.

If you don’t specify any source, destination, or service value, it will be displayed as "Any" by default.

- Directions – click to specify that the traffic from or to the specified source(s), destination(s), and service(s) will be accepted by the firewall.
- Actions – click to specify that the traffic from or to the specified source(s), destination(s), and service(s) will be allowed by the firewall.
- Logging – move the slider to the right to enable logging for this rule.

4. Click Save below the table to apply the changes.

2.10.2.3 Delete NSX-T Firewall Rule

1. Go to your Control Panel > Cloud > Edge Gateways menu.
2. Select the NSX-T tab.
3. Click specific Edge Gateway's label.
4. Click the Firewall Rules tab.
5. On the page that appears, you will see the list of firewall rules. Select a rule you want to delete from the list, and then click the button above the table.
6. Click the Save button below the table to apply the changes.

See also:
- NSX-T Integration
- Create and Manage NSX-T Edge Gateways

2.10.3 NSX-T NAT Rules

NAT (Network Address Translation) is a service that translates from private to public IP addresses. NSX-T NAT rules are completely synchronized with the vCloud, so regardless of the side from where you are updating the rules, all updates are visible on your OnApp Control Panel.

You can configure source NAT (SNAT), destination NAT (DNAT), NO SNAT, and NO DNAT rules on your NSX-T edge gateways.

- A SNAT rule translates the source IP address of packets sent from an organization VDC network out to an external network or another organization VDC network.
• A NO SNAT rule prevents the translation of the internal IP address of packets sent from an organization VDC out to an external network or another organization VDC network.

• A DNAT rule translates the IP address and, optionally, the port of packets received by an organization VDC network that are coming from an external network or another organization VDC network.

• A NO DNAT rule prevents the translation of the external IP address of packets received by an organization VDC from an external network or another organization VDC network.

2.10.3.1 Create NAT Rule
To add a new NAT rule for NSX-T integration:

1. Go to your Control Panel > Cloud > Edge Gateways > NSX-T > NSX-T edge gateway's label > NAT tab and then click .

2. On the page that appears specify the following parameters:
   For DNAT or NO DNAT rules:
   - **Label** - enter the name for a rule
   - **Description** - add description if any
   - **Application** - if you are creating a DNAT rule, select a specific application port profile to which to apply the rule. The application port profile includes a port and a protocol that the incoming traffic uses on the NSX-T edge gateway to connect to the internal network. To select none application, pick Any from the drop down list.
   - **State** - move the slider to the right to enable the rule upon creation
   - **Type** - specify type of the rule, DNAT or NO DNAT
   - **External IP** - enter the public IP address of the NSX-T edge gateway for which you are configuring the DNAT rule. The IP addresses that you enter must belong to the sub allocated IP range of the edge gateway; can be only IPv4 or CIDR
   - **Internal IP** - if you are creating a DNAT rule, enter the IP address or a range of IP addresses of the virtual server for which you are configuring DNAT so that they can receive traffic from the external network; can be only IPv4 or CIDR
   - **Internal Port** - enter a port into which the rule is translating for the packets inbound to the virtual servers
   - **Logging** - move the slider to the right to have the address translation performed by this rule logged

   For SNAT or NO SNAT rules:

1. - **Label** - enter the name for a rule
   - **Description** - add description if any
   - **State** - move the slider to the right to enable the rule upon creation
   - **Type** - select SNAT or NO SNAT
   - **External IP** - if you are creating a SNAT rule, enter the public IP address of the edge gateway for which you are configuring the SNAT rule. The IP addresses that you enter must belong to the sub allocated IP range of the edge gateway; can be only IPv4 or CIDR
Internal IP - enter the IP address or a range of IP addresses of the virtual servers for which you are configuring the rule so that they can send traffic to the external network; can be only IPv4 or CIDR

Destination IP - if you want the rule to apply only for traffic to a specific domain, enter an IP address for this domain or an IP address range in CIDR format. If you leave this field blank, the SNAT rule applies to all destinations outside of the local subnet

Logging - move the slider to the right to have the address translation performed by this rule logged

4. Click Save to save the changes.

2.10.3.2 Delete NAT Rule
1. Go to your Control Panel > Cloud > Edge Gateways > NSX-T > NSX-T edge gateway's label > NAT tab.
2. On the page that appears, select the rules to be deleted from the list of NAT rules and then click above the table.

2.11 VMware Cloud Director Permissions

The list below includes the permissions related to VMware Cloud Director resources.

- Users with the Administrator role in OnApp have VMware Cloud Director related permissions enabled by default. They can create and manage VMware Cloud Director resources if there is a VMware Cloud Director compute resource in the cloud.
- The VMware Cloud Director permissions list is not updated in OnApp for custom roles imported from VCD.

2.11.1 The list of permissions:

- Catalogs
- Buckets
- Dashboard
- NSX-V Edge Gateways
- NSX-T Edge Gateways
- Nat Rules
- NSX-V Firewall Rules
- NSX-V Firewall Services
- NSX-T Firewall Rules
- NSX-V IPSec Services
- NSX-V IPSec Sites
- NSX-V L2 VPN Peer Sites
- NSX-V L2 VPN Services
2.11.1.1 Catalogs
OnApp administrators can control users' ability to manage VMware Cloud Director catalogs through the Control Panel's Roles menu. You can set the following catalogs permissions for user roles:

- **Any action on Catalogs** - the user can take any action on catalogs
- **Create a new Catalog** - the user can create new catalogs
- **Delete any Catalog** - the user can delete any catalog
- **Delete own Catalogs** - the user can only delete own catalogs
- **Read any Catalog** - the user can see the list of all catalogs
- **Read own Catalogs** - the user can only see own catalogs
- **Read public Catalogs** - the user can view shared catalogs from other user groups
- **Update any Catalog** - the user can edit any catalog

For details, refer to the Catalogs section.

2.11.1.2 Buckets
OnApp administrators can control users' ability to manage the buckets. This is handled through the Control Panel's Roles menu. You can set the following bucket permissions for user roles:

- **Any action on buckets** - the user can take any action on any bucket
• Create a new bucket - the user can create a new bucket
• Delete any bucket - the user can delete any bucket
• See list of all buckets - the user can see list of all buckets
• See details of any bucket - the user can see details of any bucket
• See own bucket - the user can only see own bucket
• Update any bucket - the user can edit any bucket

For details, refer to the VMware Cloud Director Buckets section.

2.11.1.3 Dashboard
OnApp administrators can control users’ access to the dashboard through the Control Panel’s Roles menu. You can set the following VMware Cloud Director dashboard permissions for user roles:
• Show vCloud dashboard - the user can see VMware Cloud Director details on the dashboard

2.11.1.4 NSX-V Edge Gateways
OnApp administrators can control users’ ability to manage NSX-V edge gateways through the Control Panel’s Roles menu. You can set the following edge gateway permissions for user roles:
• Any action on NSX-V Edge Gateways - the user can take any action on NSX-V edge gateways
• Manage Advanced NSX-V Edge Gateway Services - the user can manage advanced NSX-V edge gateway services
• Create new NSX-V Edge Gateways - the user can create new NSX-V edge gateways
• Delete any NSX-V Edge Gateways - the user can delete any NSX-V edge gateways
• Delete own NSX-V Edge Gateways - the user can delete only own NSX-V edge gateways
• Manage Services in vCD UI - the user has access to the edge gateways services in VCD UI
• Read any NSX-V Edge Gateways - the user can see the list of all NSX-V edge gateways under the NSX-V tab at Control Panel > Edge Gateways
• Read own NSX-V Edge Gateways - the user can only see their own NSX-V edge gateways under the NSX-V tab at Control Panel > Edge Gateways
• Update any NSX-V Edge Gateways - the user can update any NSX-V edge gateways
• Update own NSX-V Edge Gateways - the user can update only their own NSX-V edge gateways

For details, refer to the NSX-V Edge Gateways section.

2.11.1.5 NSX-T Edge Gateways
OnApp administrators can control users’ ability to manage their own NSX-T edge gateways through the Control Panel’s Roles menu. You can set the following edge gateway permissions for user roles:
• Any action on NSX-T Edge Gateways - the user can take any action on NSX-T edge gateways
• Create NSX-T Edge Gateways - the user can create NSX-T edge gateway
• Delete NSX-T Edge Gateways - the user can delete NSX-T edge gateway
• See NSX-T Edge Gateways - the user has access to the NSX-T tab at Control Panel > Edge Gateways
- **Update NSX-T Edge Gateways** - the user can update NSX-T edge gateways
  
  For details, refer to the Create and Manage NSX-T Edge Gateways section.

2.11.1.6 Nat Rules

OnApp administrators can control users’ ability to manage VMware Cloud Director nat rules. This is handled through the Control Panel's Roles menu. You can set the following VMware Cloud Director nat rules permissions for user roles:

- **Any action on nat rules** - the user can take any action on nat rules
- **Create nat rules** - the user can create a nat rule in any edge gateway
- **Delete any nat rule** - the user can delete any nat rule
- **Delete own nat rules** - the user can delete only own nat rules
- **See any nat rule** - the user can see all nat rules
- **See own nat rules** - the user can see only own nat rules
- **Edit any nat rule** - the user can edit all nat rules
- **Edit own nat rules** - the user can edit only own nat rules

For details, refer to the Nat Rules section.

2.11.1.7 NSX-V Firewall Rules

OnApp administrators can control users’ ability to manage NSX-V firewall rules through the Control Panel's Roles menu. You can set the following firewall rules permissions for user roles:

- **Any action on firewall rule** - the user can take any action on NSX-V firewall rules
- **Create any firewall rule** - the user can create a new NSX-V firewall rule
- **Delete any firewall rule** - the user can delete any NSX-V firewall rule
- **See any firewall rules** - the user can see any NSX-V firewall rules
- **Update any firewall rule** - the user can edit any NSX-V firewall rule

2.11.1.8 NSX-V Firewall Services

OnApp administrators can control users’ ability to manage NSX-V firewall services through the Control Panel's Roles menu. You can set the following firewall services permissions for user roles:

- **Any action on firewall service** - the user can take any action on NSX-V firewall services
- **See any firewall service** - the user can see any NSX-V firewall service
- **Update any firewall service** - the user can edit any NSX-V firewall service

2.11.1.9 NSX-T Firewall Rules

OnApp administrators can control users’ ability to manage firewall rules assigned to NSX-T edge gateway through the Control Panel's Roles menu. You can set the following firewall rules permissions for user roles:

- **See any NSX-T Firewall** - the user can see any NSX-T firewall rule
- **Manage Firewalls** - the user can create/edit/delete NSX-T firewall rules

2.11.1.10 NSX-V IPSec Services

OnApp administrators can control users’ ability to manage NSX-V IPSec services through the Control Panel's Roles menu. You can set the following IPSec services permissions for user roles:

- **Any action on IPSec service** - the user can take any action on NSX-V IPSec services
- **See any IPSec service** - the user can see any NSX-V IPSec service
• **Update any IPSec service** - the user can edit any NSX-V IPSec service

### 2.11.1.11 NSX-V IPSec Sites
OnApp administrators can control users' ability to manage NSX-V IPSec sites through the Control Panel's Roles menu. You can set the following IPSec sites permissions for user roles:

- **Any action on IPSec site** - the user can take any action on NSX-V IPSec sites
- **Create IPSec sites** - the user can create an NSX-V IPSec site
- **Delete any IPSec site** - the user can delete any NSX-V L2 VPN IPSec site
- **See any IPSec site** - the user can see any NSX-V IPSec sites
- **Update any IPSec site** - the user can edit any NSX-V IPSec site

### 2.11.1.12 NSX-V L2 VPN Peer Sites
OnApp administrators can control users' ability to manage NSX-V L2 VPN peer sites through the Control Panel's Roles menu. You can set the following L2 VPN peer sites permissions for user roles:

- **Any action on L2 VPN peer site** - the user can take any action on NSX-V L2 VPN peer sites
- **Create L2 VPN peer sites** - the user can create an NSX-V L2 VPN peer site
- **Delete any L2 VPN peer site** - the user can delete any NSX-V L2 VPN peer site
- **See any L2 VPN peer site** - the user can see any NSX-V L2 VPN sites
- **Update any L2 VPN peer site** - the user can edit any NSX-V L2 VPN sites

### 2.11.1.13 NSX-V L2 VPN Services
OnApp administrators can control users' ability to manage NSX-V L2 VPN services through the Control Panel's Roles menu. You can set the following L2 VPN services permissions for user roles:

- **Any action on L2 VPN service** - the user can take any action on NSC L2 VPN services
- **See any L2 VPN service** - the user can see any NSX-V L2 VPN service
- **Update any L2 VPN service** - the user can edit any NSX-V load balancer L2 VPN services

### 2.11.1.14 NSX-V Load Balancer Application Profiles
OnApp administrators can control users' ability to manage NSX-V load balancer application profiles through the Control Panel's Roles menu. You can set the following load balancer application profiles permissions for user roles:

- **Any action on application profile** - the user can take any action on NSX-V load balancer application profiles
- **Create any application profile** - the user can create a new NSX-V load balancer application profile
- **Delete any application profile** - the user can delete any NSX-V load balancer application profile
- **See any application profile** - the user can see any NSX-V load balancer application profile
- **Update any application profile** - the user can edit any NSX-V load balancer application profile

### 2.11.1.15 NSX-V Load Balancer Application Rules
OnApp administrators can control users' ability to manage NSX-V load balancer application rules through the Control Panel's Roles menu. You can set the following load balancer application rules permissions for user roles:

- **Any action on application rules** - the user can take any action on NSX load balancer application rules
• *Create any application rule* - the user can create a new NSX-V load balancer application rule
• *Delete any application rule* - the user can delete any NSX-V load balancer application rule
• *See any application rule* - the user can see any NSX-V load balancer application rules
• *Update any application rule* - the user can edit any NSX-V load balancer application rules

2.11.1.16 NSX-V Load Balancer Monitors
OnApp administrators can control users’ ability to manage NSX-V load balancer monitors through the Control Panel's Roles menu. You can set the following load balancer monitors permissions for user roles:
• *Any action on monitors* - the user can take any action on NSX-V load balancer monitors
• *Create any monitor* - the user can create a new NSX-V load balancer monitor
• *Delete any monitor* - the user can delete any NSX-V load balancer monitor
• *See any monitor* - the user can see any NSX-V load balancer monitors
• *Update any monitor* - the user can edit any NSX-V load balancer monitors

2.11.1.17 NSX-V Load Balancer Pools
OnApp administrators can control users’ ability to manage NSX-V load balancer pools through the Control Panel's Roles menu. You can set the following load balancer pools permissions for user roles:
• *Any action on pool* - the user can take any action on NSX-V load balancer pools
• *Create any pool* - the user can create a new NSX-V load balancer pool
• *Delete any pool* - the user can delete any NSX-V load balancer pool
• *See any pool* - the user can see any NSX-V load balancer pools
• *Update any pool* - the user can edit any NSX-V load balancer pools

2.11.1.18 NSX-V Load Balancer Services
OnApp administrators can control users’ ability to manage NSX-V load balancer services through the Control Panel's Roles menu. You can set the following load balancer services permissions for user roles:
• *Any action on load balancer service* - the user can take any action on NSX-V load balancer services
• *See any load balancer service* - the user can see any NSX-V load balancer service
• *Update any load balancer service* - the user can edit any NSX-V load balancer service

2.11.1.19 NSX-V Load Balancer Virtual Servers
OnApp administrators can control users’ ability to manage NSX-V Edge internal or uplink interfaces as virtual servers through the Control Panel's Roles menu. You can set the following permissions for user roles:
• *Any action on virtual server* - the user can take any action on NSX-V load balancer virtual servers
• *Create any virtual server* - the user can create a new NSX-V load balancer virtual server
• *Delete any virtual server* - the user can delete any NSX-V load balancer virtual servers
• *See any virtual server* - the user can see any NSX-V load balancer virtual servers
• *Update any virtual server* - the user can edit any NSX-V load balancer virtual servers
2.11.1.20 NSX-V Managers
OnApp administrators can control users’ ability to manage NSX-V managers through the Control Panel's Roles menu. You can set the following NSX-V managers permissions for user roles:

- **Any action on NSX manager** - the user can take any action on NSX-V manager
- **See any NSX manager** - the user can see any NSX-V manager
- **Update any NSX manager** - the user can edit any NSX-V manager

2.11.1.21 NSX-V NAT Rules
OnApp administrators can control users’ ability to manage NSX-V NAT rules through the Control Panel's Roles menu. You can set the following NAT rules permissions for user roles:

- **Any action on nat rule** - the user can take any action on NSX-V NAT rules
- **Create any nat rule** - the user can create a new NSX-V NAT rule
- **Delete any nat rule** - the user can delete any NSX-V NAT rule
- **See any nat rule** - the user can see any NSX-V NAT rules
- **Update any nat rule** - the user can edit any NSX-V NAT rules

2.11.1.22 NSX-V NAT Services
OnApp administrators can control users’ ability to manage NSX-V NAT services through the Control Panel's Roles menu. You can set the following NAT services permissions for user roles:

- **Any action on nat service** - the user can take any action on NSX-V NAT services
- **See any nat service** - the user can see any NSX-V NAT services
- **Update any nat service** - the user can edit any NSX-V NAT services

2.11.1.23 Orchestration Models
OnApp administrators can control users’ ability to manage orchestration models through the Control Panel's Roles menu. You can set the following orchestration models permissions for user roles:

- **Create new Orchestration Model** - the user can create a new orchestration model
- **Delete any Orchestration Model** - the user can delete any orchestration model
- **Deploy any Orchestration Model** - the user can deploy any orchestration model
- **Read any Media** - the user can see any orchestration model

For details, refer to the [Orchestration Models](#) section.

2.11.1.24 Org Networks
OnApp administrators control how users can manage org networks. This is handled through the Control Panel's Roles menu. You can set the following org network permissions for user roles:

- **Any action on org networks** - the user can take any action on org networks
- **Create a new org network** - the user can create a new org network of any type
- **Create a new bridged org network** - the user can create a new direct org network
- **Create a new isolated org network** - the user can create a new isolated org network
- **Create a new routed org network** - the user can create a new routed org network
- **Destroy any org network** - the user can delete any org network
- **See all org networks** - the user can see all org networks
- **Update any org network** - the user can edit any org network

For details, refer to the [Organization Networks](#) section.
2.11.1.25 Payments
OnApp administrators control how users can manage company payments. This is handled through the Control Panel's Roles menu. You can set the following company payments permissions for user roles:

- See own company/group payments - the user can only see their own company payments

For details, refer to the Payments section.

Provider Resource Pools
OnApp administrators control whether users can view VMware Cloud Director provider resource pools. This is handled through the Control Panel's Roles menu. You can set the following provider resource pool permissions for user roles:

- Any action on Provider Resource Pools - the user can take any action on provider resource pools
- Read any Provider Resource Pool - the user can view any provider resource pool

For details, refer to the Provider Resource Pools section.

2.11.1.26 Resource Pool
OnApp administrators control how users can manage VMware Cloud Director resource pools. This is handled through the Control Panel's Roles menu. You can set the following resource pool permissions for user roles:

- Any action on Resource Pools - the user can take any action on resource pools
- Create a new Resource Pool - the user can create a new Resource Pool
- Delete any Resource Pools - the user can delete any resource pool
- Read any Resource Pool - the user can see the list of all resource pools
- Update any Resource Pool - the user can edit any Resource Pool

For details, refer to the Resource Pool section.

2.11.1.27 Resource Pool Statistics
OnApp administrators control how users can manage VMware Cloud Director resource pool statistics. This is handled through the Control Panel's Roles menu. You can set the following resource pool statistics permissions for user roles:

- Any action on resource pool statistics - the user can take any action on any resource pool statistics
- See all resource pools statistics - the user can see statistics for all resource pools
- See own resource pools statistics - the user can see statistics for own resource pools only

For details, refer to the Resource Pool Statistics section.

2.11.1.28 Tunnels
OnApp administrators control how users can manage VPN tunnels. This is handled through the Control Panel's Roles menu. You can set the following tunnels permissions for user roles:

- Any action on tunnels - the user can take any action on tunnels
- Create tunnels for anyone - the user can create tunnels for anyone
- Create own tunnels - the user can only create own tunnels
- Destroy any tunnels - the user can delete any tunnels
- Destroy own tunnels - the user can only delete own tunnels
- Read all tunnels - the user can see all tunnels
- Read own tunnels - the user can only see own tunnels
• **Update all tunnels** - the user can edit all tunnels
• **Update own tunnels** - the user can only edit own tunnels

2.11.1.29 vApps
OnApp administrators can control users’ ability to manage vApps. This is handled through the Control Panel's Roles menu. You can set the following vApps permissions for user roles:

• **Any action on vApps** – the user can take any action on vApps
• **Assign recipes to VS** – the user can assign provisioning recipes to Virtual Server on vApp deployment
• **Change vApp owner** - the user can change the owner of a vApp
• **Compose vApp** - the user can compose a vApp from vApp Templates
• **Convert vApp** – the user can convert vApp into vApp Template
• **Create a new vApp** – the user can create a new vApp
• **Customize VS guest OS** - the user can customize Virtual Server guest OS on vApp deployment
• **Delete any vApp** – the user can destroy any vApp
• **Delete own vApps** – the user can only destroy their own vApps
• **Any power action on vApps** – the user can take any power actions on vApps
• **Any power action on own vApps** – the user can only take power actions on their own vApps
• **Read any vApps** – the user can view any vApps
• **Read own vApps** – the user can only view their own vApps
• **Edit any vApp** – the user can edit any vApp
• **Edit own vApps** – the user can only edit their own vApps

For details, refer to the vApps section.

2.11.1.30 vApp Networks
OnApp administrators control how users can manage vApp networks. This is handled through the Control Panel's Roles menu. You can set the following vApp network permissions for user roles:

• **Any action on vApp networks** - the user can take any action on vApp networks
• **Create a new vApp network** - the user can create a new vApp network
• **Destroy any vApp network** - the user can delete any vApp network
• **See all vApp networks** - the user can see all vApp networks
• **Update any vApp network** - the user can edit any vApp network

For details, refer to the vApps Networks section.

2.11.1.31 vApp Templates
OnApp administrators can control users' ability to manage vApp templates. This is handled through the Control Panel's Roles menu. You can set the following vApp template permissions for user roles:

• **Any action on vApp templates** – the user can take any action on vApp templates
• **Create any vApp templates** – the user can create any vApp template
• **Delete any vApp templates** – the user can destroy any vApp template
• **See any vApp templates** - the user can see any vApp templates
• **See own vApp templates** - the user see only own vApp templates
• **See vApp templates from shared catalogs** - the user can see vApp templates from shared catalogs
• **Manage System Service Add-on** - the user can manage system service add-ons of the vApp templates

For details, refer to the [vApps Templates](#) section.

### 2.11.1.32 vCloud Permissions

OnApp administrators can control users’ ability to manage vCloud permissions. This is handled through the Control Panel's Roles menu. You can set the following VMware Cloud Director permissions for user roles:

• **Administrator Control** - the user can manage general administrative stuff (for example, edit all fields in own user profile). Without this permission the user has no ability to edit own first name, last name and email fields in user profile.

For details, refer to the [vCloud Permissions](#) section.

### 2.11.1.33 Virtual Servers

OnApp administrators can control users' ability to manage vCloud virtual servers. This is handled through the Control Panel's Roles menu. You can set the following vCloud virtual servers permissions for user roles:

• **Install VMWare tools** - the user can install VMware tools (applicable for VMware Cloud Director VSs)
• **Access To VCD UI** - the user can access VMware Cloud Director UI
• **Allow insert/eject media for all virtual server** - the user can insert/eject media for all virtual servers
• **Allow insert/eject media for own virtual server** - the user can insert/eject media for their own virtual servers

For details, refer to the [vCloud Virtual Servers](#) section.

### 2.11.1.34 Virtual Server Snapshots

OnApp administrators can control user's access to VMware virtual server snapshots. You can set the following snapshot permissions:

• **Any action on Virtual Server Snapshots** - the user can take any action on snapshots
• **Create or Restore own Virtual Server Snapshot** - the user can create/restore own snapshots
• **Destroy own Virtual Server Snapshot** - the user can delete own snapshots
• **See own Virtual Server Snapshots** - the user can see the list of own snapshots

For details, refer to [VMware Cloud Director VS Snapshots](#) section.
3  API Guide

The API Guide is updated based on features, improvements, and fixes implemented for VCD within the latest OnApp version that is OnApp 6.5 Edge 4. For earlier versions of the documentation, refer to Previous Versions.

The VMware Cloud Director API Guide includes API requests you can use to manage VCD-related entities:

- Buckets API
- Catalogs API
- Company Billing Plans API
- Company Payments API
- External Networks API
- Firewall Rules API
- Network Interfaces API
- Cross VDC Networks API
- Orchestration Models API
- Organizations API
- Organization Networks API
- Resource Pools API
- User Groups API
- Users API
- vApps API
- vApp Networks API
- vCloud Virtual Servers API
- vCloud VS Snapshots API
- System Configuration API
- NSX-V Integration API
- NSX-T Integration API

For information on managing VCD entities in OnApp UI, refer to the Administration Guide or User Guide.

3.1 Buckets API

Buckets define the resource allocation and prices for resources in the cloud. They are made up of two parts:

- Access Control which defines the resources the user under the bucket has access to
- Rate Card which includes the prices for resource usage

This section contains the API requests you can use to manage buckets.
3.1.1 Get List of Buckets

To get the list of buckets, use the following request:

```
GET /billing/buckets.xml
GET /billing/buckets.json
```

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```
<buckets type="array">
  <bucket>
    <id type="integer">3</id>
    <label>ut</label>
    <created_at type="dateTime">2017-06-26T08:48:05+00:00</created_at>
    <updated_at type="dateTime">2017-06-26T08:48:05+00:00</updated_at>
    <currency_code>USD</currency_code>
    <show_price nil="true"/>
    <monthly_price type="decimal">1.0</monthly_price>
    <allows_mak type="boolean">true</allows_mak>
    <allows_kms type="boolean">true</allows_kms>
    <allows_own type="boolean">true</allows_own>
    <associated_with_users type="integer">1</associated_with_users>
  </bucket>
</buckets>
```

**Where:**

- `id` - the bucket ID
- `label` - the bucket name
- `created_at` - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- `updated_at` - the date when the bucket was updated in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- `currency_code` - the currency in which the users are charged
- `show_price` - true, if users can see the prices set up for them, otherwise false
- `monthly_price` - the monthly fee for bucket usage
- `allows_mak` - true, if the MAK licensing is allowed, otherwise false
- `allows_kms` - true, if the KMS licensing is allowed for this bucket, otherwise false
- `allows_own` - true, if adding own licenses is allowed for this bucket, otherwise false
- `associated_with_users` - the number of users with which this bucket is associated
3.1.2 Get Bucket Details

To get bucket details, use the following request:

GET /billing/buckets/id.xml
GET /billing/buckets/id.json

XML Request Example

JSON Request Example

XML Output Example

```xml
<buckets type="array">
  <bucket>
    <id type="integer">21</id>
    <label>minima</label>
    <created_at type="dateTime">2017-06-26T08:48:09+00:00</created_at>
    <updated_at type="dateTime">2017-06-26T08:48:09+00:00</updated_at>
    <currency_code>USD</currency_code>
    <show_price nil="true"/>
    <monthly_price type="decimal">1.0</monthly_price>
    <allows_mak type="boolean">true</allows_mak>
    <allows_kms type="boolean">true</allows_kms>
    <allows_own type="boolean">true</allows_own>
    <type>Billing::Buckets::Plan</type>
    <associated_with_users type="integer">1</associated_with_users>
  </bucket>
</buckets>
```

Where:

- **id** - the bucket ID
- **label** - the bucket name
- **created_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the bucket was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- **currency_code** - the currency in which the users are charged
- **show_price** - true, if users can see the prices set up for them, otherwise false
- **monthly_price** - the monthly fee for bucket usage
- **allows_mak** - true, if the MAK licensing is allowed, otherwise, false
- **allows_kms** - true, if the KMS licensing is allowed for this bucket, otherwise, false
- **allows_own** - true, if adding own licenses is allowed for this bucket, otherwise, false
- **type** - the type of bucket
- **associated_with_users** - the number of users with which this bucket is associated
3.1.3 Add Bucket

To create a new bucket, use the following request:

POST /billing/buckets.xml
POST /billing/buckets.json

**XML Request Example**

```
curl -i -X POST http://onapp.test/billing/buckets.xml -H 'Accept: application/xml' -H 'Content-Type: application/xml' -u user:userpass -d '<bucket><label>Label</label><currency_code>USD</currency_code><monthly_price type="integer">10</monthly_price><allows_kms type="boolean">false</allows_kms><allows_mak type="boolean">true</allows_mak><allows_own type="boolean">false</allows_own></bucket>'
```

**JSON Request Example**

```
```

Where:

- **label** - the bucket name
- **currency_code** - the currency that users will be charged in within this bucket (USD by default)
- **monthly_price** - set the monthly fee for bucket usage
- **allows_kms** - true, if the KMS licensing is allowed for this bucket, otherwise, false
- **allows_mak** - true, if the MAK licensing is allowed, otherwise, false
- **allows_own** - true, if adding own licenses is allowed for this bucket, otherwise, false

3.1.4 Edit Bucket

To edit a bucket, use the following request:

PUT /billing/buckets/14.xml
PUT /billing/buckets/13.json

**XML Request Example**

```
```

**JSON Request Example**

```
```
Where:

*label* - the bucket name

*monthly_price* - set the monthly fee for bucket usage

### 3.1.5 Clone Bucket

To clone a bucket with its prices and added resources, use the following request:

```
POST /billing/buckets/:bucket_id/clone.xml
POST /billing/buckets/:bucket_id/clone.json
```

**XML Request Example**

```
```

**JSON Request Example**

```
```

Where you indicate in the URL the ID of the cloned bucket.

### 3.1.6 Delete Bucket

Use the following API request to delete a bucket:

```
DELETE /billing/buckets/id.xml
DELETE /billing/buckets/id.json
```

**XML Request Example**

```
```

**JSON Request Example**

```
```

Returns HTTP 204 response on successful processing, and HTTP 404 when there is no bucket with a requested ID or URL is incorrect.

### 3.1.7 Access Control

The Access Control is the part of the bucket which defines the resources to which a user under the bucket has access. In Access Control, you define the maximum/minimum/default limits for resource usage. If a resource is not added to the Access Control a user under the bucket will
not have access to that resource. This section contains the API requests you can use to manage Access Controls.

3.1.7.1 Get List of Access Controls for VPC Server Type

To get the list of access controls, use the following request:

GET /billing/buckets/:bucket_id/access_controls.xml
GET /billing/buckets/:bucket_id/access_controls.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example
<access_controls type="array">
<access_control>
  <bucket_id type="integer">24</bucket_id>
  <server_type>vpc</server_type>
  <target_id type="integer">2</target_id>
  <data_store_zone_resource type="vpc">
    <target_name>Default DataStore Zone</target_name>
    <limits>
      <limit_min_allocation_cpu_allocation type="decimal">1.0</limit_min_allocation_cpu_allocation>
      <limit_min_allocation_memory_allocation type="decimal">1.0</limit_min_allocation_memory_allocation>
      <limit_min_allocation_cpu_resources_guaranteed type="decimal">0.0</limit_min_allocation_cpu_resources_guaranteed>
      <limit_min_allocation_vcpu type="decimal">1.0</limit_min_allocation_vcpu>
      <limit_min_allocation_memory_resources_guaranteed type="decimal">1.0</limit_min_allocation_memory_resources_guaranteed>
      <limit_min_allocation_vcpu_speed type="decimal">1.0</limit_min_allocation_vcpu_speed>
      <limit_allocation_cpu_allocation type="decimal">1.0</limit_allocation_cpu_allocation>
      <limit_allocation_memory_allocation type="decimal">1.0</limit_allocation_memory_allocation>
      <limit_allocation_cpu_resources_guaranteed type="decimal">1.0</limit_allocation_cpu_resources_guaranteed>
      <limit_allocation_vcpu type="decimal">2.0</limit_allocation_vcpu>
      <limit_allocation_memory_resources_guaranteed type="decimal">1.0</limit_allocation_memory_resources_guaranteed>
      <limit_allocation_vcpu_speed type="decimal">1.0</limit_allocation_vcpu_speed>
      <limit_min_reservation_cpu_allocation type="decimal">1.0</limit_min_reservation_cpu_allocation>
      <limit_min_reservation_vcpu type="decimal">1.0</limit_min_reservation_vcpu>
      <limit_min_reservation_memory_allocation type="decimal">1.0</limit_min_reservation_memory_allocation>
      <limit_min_pay_as_you_go_cpu_limit type="decimal">1.0</limit_min_pay_as_you_go_cpu_limit>
      <limit_min_pay_as_you_go_vcpu type="decimal">1.0</limit_min_pay_as_you_go_vcpu>
      <limit_min_pay_as_you_go_memory_limit type="decimal">1.0</limit_min_pay_as_you_go_memory_limit>
      <limit_pay_as_you_go_cpu_limit type="decimal">1.0</limit_pay_as_you_go_cpu_limit>
      <limit_pay_as_you_go_vcpu type="decimal">1.0</limit_pay_as_you_go_vcpu>
      <limit_pay_as_you_go_memory_limit type="decimal">1.0</limit_pay_as_you_go_memory_limit>
      <limit_vs_cpu type="decimal">1.0</limit_vs_cpu>
      <limit_vs_memory type="decimal">1.0</limit_vs_memory>
    </limits>
  </data_store_zone_resource>
</access_control>
<access_control>...</access_control>
<access_controls>

Where:

- **bucket_id** - the ID of the bucket with which this access control is associated
- **server_type** - the server type this access control is applicable to. For VPS resources, it is `vpc`.
**target_id** - the ID of the resource for which access control is configured

**type** - the type of the resource for which configuration is set, it can be one of the following values:
- `virtual_servers_resource`
- `application_servers_resource`
- `compute_zone_resource`
- `data_store_zone_resource`
- `network_zone_resource`

**timing_strategy** - the type of billing for each resource: hourly or monthly (on peak usage)

**target_name** - the name of the resource that is added to access control. For example, it can be a label of a template group or a compute zone, etc.

**limits** - the array of limits for the resource. Depending on the type of the resource, you can have the following limits:

### VPC Server Type

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>virtual_servers_resource</td>
<td>limit</td>
<td>the total amount of VSs the users can create in the cloud (VS/hour)</td>
</tr>
<tr>
<td>application_servers_resource</td>
<td>limit</td>
<td>the total amount of application servers that the users can create in the cloud (application VS/hour)</td>
</tr>
<tr>
<td>compute_zone_resource</td>
<td>limit_min_allocation_cpu_allocation</td>
<td>the minimum amount of CPU users can request for each VMware Cloud Director resource pool in the compute zone (GHz/limit_type)</td>
</tr>
<tr>
<td></td>
<td>limit_min_allocation_memory_allocation</td>
<td>the minimum amount of Memory users can request for each VMware Cloud Director resource pool in the compute</td>
</tr>
</tbody>
</table>

### VPC Server Type

<table>
<thead>
<tr>
<th>Zone</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>limit_min_allocation_cpu_resources_guaranteed</strong></td>
<td>the minimum amount of CPU Resources users can request for each VMware Cloud Director resource pool in the compute zone (%/limit_type)</td>
</tr>
<tr>
<td><strong>limit_min_allocation_vcpu</strong></td>
<td>the minimum amount of vCPU Resources users can request for each VMware Cloud Director resource pool in the compute zone (cores/limit_type)</td>
</tr>
<tr>
<td><strong>limit_min_allocation_memory_resources_guaranteed</strong></td>
<td>the minimum amount of Memory Resources users can request for each VMware Cloud Director resource pool in the compute zone (%/limit_type)</td>
</tr>
<tr>
<td><strong>limit_min_allocation_vcpu_speed</strong></td>
<td>the minimum amount of vCPU speed users can request for each VMware Cloud Director resource pool in the compute zone (MHz/limit_type)</td>

</tbody>
</table>
v.6.3 Edge 1

- added the following parameters:
  - limit_min_allocation_vcpu
  - limit_allocation_vcpu
  - limit_min_reservation_vcpu
  - limit_min_pay_as_you_go_vcpu
  - limit_pay_as_you_go_vcpu
  - limit_reservation_vcpu

3.1.7.2 Add Access Control for VPC

To create a new access control, use the following request:

POST /billing/buckets/:bucket_id/access_controls.xml

POST /billing/buckets/:bucket_id/access_controls.json

**XML Request Example**

```bash
curl -i -X POST http://onapp.test/billing/buckets/1/access_controls.xml -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d '
<access-control><target-id type="integer">30</target-id><type>compute_zone_resource</type><bucket-id type="integer">1</bucket-id><server-type>vpc</server-type><apply_to_all_resources_in_the_bucket>true</apply_to_all_resources_in_the_bucket><limits><limit_cpu_share>1</limit_cpu_share><limit_cpu_units>1</limit_cpu_units><limit_memory>1</limit_memory><limit_default_cpu>1</limit_default_cpu><limit_min_cpu>1</limit_min_cpu><limit_min_memory>1</limit_min_memory><limit_default_cpu_share>1</limit_default_cpu_share><limit_min_cpu_priority>1</limit_min_cpu_priority><use_cpu_units>1</use_cpu_units><limit_nsxt_edge_gateways type="integer">13</limit_nsxt_edge_gateways></limits></access-control>
```

**JSON Request Example**

```bash
curl -i -X POST http://onapp.test/billing/buckets/1/access_controls.json -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' -d '
{"target_id":30,"type":"compute_zone_resource","bucket_id":1,"server_type":"vpc","apply_to_all_resources_in_the_bucket":true,"limits":{"limit_cpu_share":1.0,"limit_cpu_units":1.0,"limit_memory":1.0,"limit_default_cpu":1.0,"limit_min_cpu":1.0,"limit_min_memory":1.0,"limit_default_cpu_share":1.0,"limit_min_cpu_priority":1.0,"use_cpu_units":1.0,"limit_nsxt_edge_gateways": 8}}
```

Where:

target_id - the ID of the resource for which access control is configured

type* - the type of the resource, it can be one of the following values:

- virtual_servers_resource
- application_servers_resource
- compute_zone_resource
- data_store_zone_resource
network_zone_resource

- `bucket_id` * - the ID of the bucket with which this access control is associated
- `server_type` * - the server type this access control is applicable to. For VPS resources, it is `vpc`.
- `target_name` - the name of the resource that is added to the access control. For example, it can be a label of a network or compute zone, etc.

`limits` - the array of limits for a resource. Depending on the type of the resource, you can have limits described in the table below.

`apply_to_all_resources_in_the_bucket` - set to `true` to apply limits that you pass for a zone resource to all resources of the same type in the bucket. The parameter is applicable to the following resource types:

- compute_zone_resource
- data_store_zone_resource
- network_zone_resource

**Page History**

v.6.5 Edge 4
- added `limit_nsxt_edge_gateways` parameter

v.6.3 Edge 1
- added the following parameters:
  - `limit_min_allocation_vcpu`
  - `limit_allocation_vcpu`
  - `limit_min_reservation_vcpu`
  - `limit_min_pay_as_you_go_vcpu`
  - `limit_pay_as_you_go_vcpu`
  - `limit_reservation_vcpu`

3.1.7.3 Edit Access Control for VPC Server Type

To edit access control, use the following request:

PUT /billing/buckets/:bucket_id/access_controls.xml
PUT /billing/buckets/:bucket_id/access_controls.json

**XML Request Example**

```
curl -i -X PUT http://onapp.test/billing/buckets/1/access_controls.xml -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d '<access-control><target_id type="integer">30</target_id><type>compute_zone_resource</type><bucket_id type="integer">1</bucket_id><server_type>vpc</server_type><apply_to_all_resources_in_the_bucket>true</apply_to_all_resources_in_the_bucket><limits><limit_cpu_share>1</limit_cpu_share><limit_cpu_units>1</limit_cpu_units><limit_memory>1</limit_memory><limit_default_cpu>1</limit_default_cpu><limit_min_cpu>1</limit_min_cpu><limit_min_memory>1</limit_min_memory><limit_default_cpu_share>1</limit_default_cpu_share><limit_min_cpu_priority>1</limit_min_cpu_priority><use_cpu_units>1</use_cpu_units><limit_nsxt_edge_gateways type="integer">15</limit_nsxt_edge_gateways></limits></access-control>'
```
JSON Request Example

curl -i -X PUT http://onapp.test/billing/buckets/1/access_controls.json -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' -d '{"target_id":30,"type":"compute_zone_resource","bucket_id":1,"server_type ":"vpc","apply_to_all_resources_in_the_bucket":true,"limits":{"limit_cpu_share":1.0,"limit_cpu_units":1.0,"limit_memory":1.0,"limit_default_cpu":1.0,"limit_min_cpu":1.0,"limit_min_memory":1.0,"limit_default_cpu_share":1.0,"limit_min_cpu_priority":1.0,"use_cpu_units":1.0,"limit_nsxt_edge_gateways": 8}}'

Where:

target_id - the ID of the resource for which access control is configured
type* - the type of the resource, it can be one of the following values:
- virtual_servers_resource
- application_servers_resource
- compute_zone_resource
- data_store_zone_resource
- network_zone_resource
bucket_id* - the ID of the bucket with which this access control is associated
server_type* - the server type this access control is applicable to. For VPS resources, it is VPC.
apply_to_all_resources_in_the_bucket - set to true to apply limits that you pass for a zone resource to all resources of the same type in the bucket. The parameter is applicable to the following recourse types:
- compute_zone_resource
- data_store_zone_resource
- network_zone_resource
limits - the array of limits for a resource. Depending on the type of resource, you can have limits described in the table below.

<table>
<thead>
<tr>
<th>VPC Server Type</th>
<th>Type</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>virtual_servers_resource</td>
<td>limit</td>
<td>the total amount of VSs the users can create in the cloud (VS/hour)</td>
</tr>

<tr>
<td><strong>limit_min_cpu_priority</strong></td>
<td>the minimum amount of CPU priority which can be set in the VS creation wizard when the user adds a VS under this bucket in the compute zone (CPU share %/hour)</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>use_cpu_units</strong></td>
<td>set to &quot;1&quot; to use CPU shares instead of CPU priority (CPU unit/hour). Otherwise, set to &quot;0&quot;. Set the number of CPU units available to users under this bucket using the limit_cpu_units parameter.</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>limit_nsxt_edge_gateways</strong></td>
<td>the maximum number of NSX-T edge gateways that can be created in a compute zone</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>data_store_zone_resource</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>limit_min_disk_size</strong></td>
<td>the minimum amount of disk size (users can request for each storage policy (data store) in a provider storage policy (data store zone) (GB/hour)</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>limit_disk_size</strong></td>
<td>the maximum amount of disk size users can request for each storage policy (data store) in a provider storage policy (data store zone) (GB/hour)</td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>limit_vs_disk_size</strong></td>
<td>the maximum amount of disk size that users can request for all VSs</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### VPC Server Type

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>network_zone_resource</td>
<td>totally within the whole data store zone (GB/hour)</td>
</tr>
<tr>
<td>limit_ip</td>
<td>the maximum number of IP Addresses users can request to deploy Edge Gateways for the whole network zone (IP/hour)</td>
</tr>
<tr>
<td>limit_vs_ip</td>
<td>the maximum amount of IP addresses that users can allocate to deploy/recompose a vApp within the whole network zone (IP/hour)</td>
</tr>
</tbody>
</table>

**Page History**

v.6.5 Edge 4
- added limit_nsxt_edge_gateways parameter

### 3.1.7.4 Delete Resource from Access Control for VPC Server Type

If you remove a compute/data store/network zone from the Access Control, it will not be possible to edit the resources of the servers running in this zone(s).

To delete resources from access controls, use the following request:

DELETE /billing/buckets/:bucket_id/access_controls.xml
DELETE /billing/buckets/:bucket_id/access_controls.json

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```

**Where:**
**type** - the type of the resource for which configuration is set, it can be one of the following values:

- `virtual_servers_resource`
- `application_servers_resource`
- `compute_zone_resource`
- `data_store_zone_resource`
- `network_zone_resource`

**bucket_id** - the ID of the bucket with which this access control is associated

**server_type** - the server type this access control is applicable to. For VPS resources, it is `vpc`.

**target_id** - the ID of the resource for which configuration is set

### 3.1.7.5 Get List of Access Controls for Other Server Type

To get the list of access controls, use the following request:

GET `/billing/buckets/:bucket_id/access_controls.xml`

GET `/billing/buckets/:bucket_id/access_controls.json`

#### XML Request Example

```
curl -i -X GET http://onapp.test/billing/buckets/5263/access_controls.xml
-u user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml'
```

#### JSON Request Example

```
curl -i -X GET http://onapp.test/billing/buckets/5263/access_controls.json
-u user:userpass -H 'Accept: application/json' -H 'Content-type: application/json'
```

#### XML Output Example

```
<access_controls type="array">
  <access_control>
    <bucket_id type="integer">5263</bucket_id>
    <server_type>other</server_type>
    <target_id type="integer">14</target_id>
    <type>template_groups_resource</type>
    <timing_strategy>hourly</timing_strategy>
    <target_name>RHEL</target_name>
    <limits></limits>
  </access_control>
  ... (additional access controls)
</access_controls>
```

**Where:**

- `bucket_id` - the ID of the bucket with which this access control is associated
- `server_type` - the server type this access control is applicable to, in this case, `other`
- `target_id` - the ID of the resource for which configuration is set
type - the type of the resource for which configuration is set, it can be one of the following values:

- `edge_groups_resource`
- `template_groups_resource`
- `recipe_groups_resource`
- `service_addon_groups_resource`

timing_strategy - the type of billing for each resource: `hourly` or `monthly` (on peak usage)

target_name - the label of the resource added to the access control

limits - the array of limits for the resource. The access control for Other resources does not contain limits.

### 3.1.7.6 Add Access Control for Other Server Type

To create a new access control, use the following request:

**POST /billing/buckets/:bucket_id/access_controls**

**XML Request Example**

```
curl -i -X POST http://onapp.test/billing/buckets/331/access_controls.xml
-u user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml' -d
'\t<access_control><bucket_id>331</bucket_id><server_type>other</server_type>
     <target_id>2</target_id><create_rate_card>false</create_rate_card><type>recipe_groups_resource</type><target_name>RecipeGroup1</target_name></access_control>'
```

**JSON Request Example**

```
curl -i -X POST http://onapp.test/billing/buckets/331/access_controls.json
-u user:userpass -H 'Accept: application/json' -H 'Content-type: application/json' -d
'\"access_control\": {\"bucket_id\": 331, \"server_type\": \"other\", \"target_id\": 2, \"create_rate_card\": false, \"type\": \"recipe_groups_resource\", \"target_name\": \"RecipeGroup1\"}}'
```

**Where:**

- **bucket_id** - the ID of the bucket with which this access control is associated
- **server_type** - the server type this access control is applicable to, in this case, `other`
- **target_id** - the ID of the resource added to the access control
- **create_rate_card** - set `true` if you want to add this resource not only to the access control, but to the rate card as well, otherwise, set `false`
- **type** - the type of the resource for which configuration is set, it can be one of the following values:
  - `template_groups_resource`
• edge_groups_resource

• recipe_groups_resource

• service_addon_groups_resource

target_name - the name of the resource that is added to the access control. For example, it can be a label of a recipe group.

3.1.7.7 Edit Access Control for Other Server Type
To edit access control, use the following request:

PUT /billing/buckets/:bucket_id/access_controls.xml
PUT /billing/buckets/:bucket_id/access_controls.json

XML Request Example

curl -i -X PUT http://onapp.test/billing/buckets/331/access_controls.xml -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d '<access_control><bucket_id>331</bucket_id><server_type>other</server_type><target_id>2</target_id><create_rate_card>false</create_rate_card><type>recipe_groups_resource</type><target_name>RecipeGroup1</target_name></access_control>'

JSON Request Example

curl -i -X PUT http://onapp.test/billing/buckets/331/access_controls.json -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' -d '{"access_control": {"bucket_id": 331, "server_type": "other", "target_id": 2, "type": "recipe_groups_resource", "target_name": "RecipeGroup1"}}'

Where:
bucket_id * - the ID of the bucket with which this access control is associated
server_type* - the server type this access control is applicable to, in this case, other
target_id - the ID of the resource added to the access control
type - the type of the resource for which configuration is set. For CDN resources, it can be one of the following values:

• template_groups_resource

• edge_groups_resource

• recipe_groups_resource

• service_addon_groups_resource
target_name - the name of the resource that is added to the access control. For example, it can be a label of a recipe group.

3.1.7.8 Delete Resource from Access Control for Other Server Type
To delete a resource from access controls, use the following request:
DELETE /billing/buckets/:bucket_id/access_controls.xml
DELETE /billing/buckets/:bucket_id/access_controls.json

XML Request Example

```
curl -i -X DELETE
http://onapp.test/billing/buckets/331/access_controls/delete.xml -u
user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml' -d
'=<access_control><type>recipe_groups_resource</type><bucket_id>331</bucket_id><server_type>other</server_type><target_id>2</target_id></access_control>'
```

JSON Request Example

```
curl -i -X DELETE
http://onapp.test/billing/buckets/331/access_controls/delete.json -u
user:userpass -H 'Accept: application/json' -H 'Content-type: application/json' -d
'{"access_control": {"type": "recipe_groups_resource", "bucket_id": 331, "server_type": "other", "target_id": 2}}'
```

Where:

type - the type of the resource to be deleted from access control, it can be one of the following values:

- template_groups_resource
- edge_groups_resource
- recipe_groups_resource
- service_addon_groups_resource

bucket_id - the ID of the bucket with which this access control is associated
server_type - the server type this access control is applicable to, in this case, other
target_id - the ID of the resource to be deleted

3.1.8 Rate Card

Rate Cards are the part of buckets that contain the free limits for resources and prices for resource usage. This section contains the API requests which you can use to manage Rate Cards.

3.1.8.1 Get the List of Rate Cards for VPC Server Type
To get the list of rate cards, use the following request:

GET /billing/buckets/:bucket_id/rate_cards.xml
GET /billing/buckets/:bucket_id/rate_cards.json

XML Request Example

JSON Request Example

XML Output Example

```
<rate_cards type="array">
  <rate_card>
    <bucket_id type="integer">24</bucket_id>
    <legacy_resource_id nil="true"/>
    <server_type>vpc</server_type>
    <server_type>vpc</server_type>
    <type>compute_resource_storing_resource</type>
    <type>compute_resource_storing_resource</type>
    <timing_strategy>hourly</timing_strategy>
    <timing_strategy>hourly</timing_strategy>
    <prices>
      <prices>
        <limit_free type="decimal">1.0</limit_free>
        <limit_free type="decimal">1.0</limit_free>
        <price type="decimal">11.0</price>
        <price type="decimal">11.0</price>
      </prices>
      <prices>
    </rate_card>
  </rate_card>
</rate_cards>
```

Where:

- **bucket_id** - the ID of the bucket with which this rate card is associated.
- **legacy_resource_id** - the resource ID from the bucket present before OnApp 5.6.
- **server_type** - the server type this rate card is applicable to. Can be virtual, smart, baremetal or vpc.
- **timing_strategy** - the type of billing for each resource: hourly or monthly (on peak usage).
- **target_id** - the ID of the resource for which the prices are set.
- **target_name** - the name of the resource that is added to the bucket. For example, this can be the label of a template group or a compute zone, etc.
- **target_type** - the type of the resource for which configuration is set. The value can be one of the following:
  - `compute_zone`
  - `data_store_zone`
  - `network_zone`
  - `backup_server_zone`
  - `instance_package`
  - `template_group`
  - `edge_group`
  - `recipe_group`
- `service_addon_group`
- `service_addon_target`
- `service_addon`
- `template`

*type* - the type of resource. Depending on the type of resource, you will have the following price parameters:

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>compute_zone_resource</code></td>
<td><code>limit_free_allocation_cpu_allocation</code></td>
<td>the amount of CPU that users get for free per hour or per month (depending on selected pricing type) in this compute zone under this bucket (GHz/ limit_type)</td>
</tr>

</table>

**Page History**

v.6.3 Edge 1
- added the following parameters:
  - `limit_free_allocation_vcpu`
  - `limit_free_reservation_vcpu`
  - `limit_free_pay_as_you_go_vcpu`
  - `price_allocation_vcpu`
3.1.8.2 Add Rate Cards for VPC Server Type

To add rate cards, use the following request:

**POST /billing/buckets/:bucket_id/rate_cards.xml**

**POST /billing/buckets/:bucket_id/rate_cards.json**

**XML Request Example**

```xml
<rate_card>
  <target id type="integer">30</target>
  <prices>
    <limit_free_allocation_cpu_allocation>0.0</limit_free_allocation_cpu_allocation>
    <limit_free_allocation_cpu_resources_guaranteed>0.0</limit_free_allocation_cpu_resources_guaranteed>
    <limit_free_allocation_cpu_used>0.0</limit_free_allocation_cpu_used>
    <limit_free_allocation_cpu_vcpu>0</limit_free_allocation_cpu_vcpu>
    <limit_free_allocation_cpu_vcpu_speed>0</limit_free_allocation_cpu_vcpu_speed>
    <limit_free_allocation_memory_allocation>0.0</limit_free_allocation_memory_allocation>
    <limit_free_allocation_memory_resources_guaranteed>0.0</limit_free_allocation_memory_resources_guaranteed>
    <limit_free_allocation_memory_used>0.0</limit_free_allocation_memory_used>
    <limit_free_allocation_memory_vcpu>0</limit_free_allocation_memory_vcpu>
    <limit_free_allocation_memory_vcpu_speed>0</limit_free_allocation_memory_vcpu_speed>
    <limit_free_allocation_reservation_cpu_allocation>0.0</limit_free_allocation_reservation_cpu_allocation>
    <limit_free_allocation_reservation_memory_allocation>0.0</limit_free_allocation_reservation_memory_allocation>
    <limit_free_allocation_reservation_vcpu>0</limit_free_allocation_reservation_vcpu>
    <price_allocation_cpu_allocation>0.00</price_allocation_cpu_allocation>
    <price_allocation_cpu_resources_guaranteed>0.00</price_allocation_cpu_resources_guaranteed>
    <price_allocation_cpu_used>0.00</price_allocation_cpu_used>
    <price_allocation_memory_allocation>0.00</price_allocation_memory_allocation>
    <price_allocation_memory_resources_guaranteed>0.00</price_allocation_memory_resources_guaranteed>
    <price_allocation_memory_used>0.00</price_allocation_memory_used>
    <price_allocation_vcpu>0.00</price_allocation_vcpu>
    <price_allocation_vcpu_speed>0.00</price_allocation_vcpu_speed>
    <price_pay_as_you_go_cpu_limit>0.00</price_pay_as_you_go_cpu_limit>
    <price_pay_as_you_go_cpu_limit_unlimited>0.00</price_pay_as_you_go_cpu_limit_unlimited>
    <price_pay_as_you_go_cpu_used>0.00</price_pay_as_you_go_cpu_used>
    <price_pay_as_you_go_memory_limit>0.00</price_pay_as_you_go_memory_limit>
    <price_pay_as_you_go_memory_limit_unlimited>0.00</price_pay_as_you_go_memory_limit_unlimited>
    <price_pay_as_you_go_memory_used>0.00</price_pay_as_you_go_memory_used>
    <price_pay_as_you_go_vcpu>0.00</price_pay_as_you_go_vcpu>
    <price_pay_as_you_go_vcpu_speed>0.00</price_pay_as_you_go_vcpu_speed>
    <price_reservation_cpu_allocation>0.00</price_reservation_cpu_allocation>
    <price_reservation_cpu_limit>0.00</price_reservation_cpu_limit>
    <price_reservation_cpu_limit_unlimited>0.00</price_reservation_cpu_limit_unlimited>
    <price_reservation_cpu_used>0.00</price_reservation_cpu_used>
    <price_reservation_memory_allocation>0.00</price_reservation_memory_allocation>
    <price_reservation_memory_limit>0.00</price_reservation_memory_limit>
    <price_reservation_memory_limit_unlimited>0.00</price_reservation_memory_limit_unlimited>
    <price_reservation_memory_used>0.00</price_reservation_memory_used>
  </prices>
  <server_type>vpc</server_type>
  <timing_strategy>monthly</timing_strategy>
</rate_card>
```

Where:

`bucket_id` * - the ID of the bucket with which this rate card is associated

`server_type` * - the server type this rate card is applicable to. Can be virtual, smart, baremetal, or vpc.

`target_id` - the ID of the resource for which the prices are set

`type` * - the type of resource that can be one of the following values:

- `compute_zone_resource`
- `data_store_zone_resource`
- `network_zone_resource`

`timing_strategy` - the type of billing for each resource: `hourly` or `monthly` (on peak usage)

`target_name` - the name of the resource that is added to the access control. For example, it can be a label of a network or compute zone, etc.

`prices` - the array of resource prices and free limits

VPC Server

| price_data_received | the price over free units per GB per hour or per month (depending on selected pricing type) for received data in this network zone (GB/limit_type) |

Page History

v.6.5 Edge 4
- added the following parameters:
  - `price_nsxt_edge_gateways`
  - `limit_free_nsxt_edge_gateways`

v.6.3 Edge 1
- added the following parameters:
  - `limit_free_allocation_vcpu`
  - `limit_free_reservation_vcpu`
  - `limit_free_pay_as_you_go_vcpu`
  - `price_allocation_vcpu`
  - `price_reservation_vcpu`
  - `price_pay_as_you_go_vcpu`

3.1.8.3 Edit Rate Cards for VPC Server Type

To edit rate cards, use the following request:

POST /billing/buckets/:bucket_id/rate_cards.xml

POST /billing/buckets/:bucket_id/rate_cards.json

XML Request Example

curl -i -X PUT http://onapp.test/billing/buckets/1/rate_cards.xml -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d "<rate_card><target id type="integer">30</target>
<prices><limit_free_allocation_cpu_allocation>0.0</limit_free_allocation_cpu_allocation><limit_free_allocation_cpu_resources_guaranteed>0.0</limit_free_allocation_cpu_resources_guaranteed><limit_free_allocation_cpu_used>0.0</limit_free_allocation_cpu_used><limit_free_allocation_memory_allocation>0.0</limit_free_allocation_memory_allocation><limit_free_allocation_memory_resources_guaranteed>0.0</limit_free_allocation_memory_resources_guaranteed><limit_free_allocation_memory_used>0.0</limit_free_allocation_memory_used><limit_free_allocation_vcpu>0</limit_free_allocation_vcpu><limit_free_allocation_vcpu_speed>0</limit_free_allocation_vcpu_speed><limit_free_reservation_cpu_allocation>0.0</limit_free_reservation_cpu_allocation><limit_free_reservation_cpu_allocation>0.0</limit_free_reservation_cpu_allocation>"

<td>hour or per month (depending on selected pricing type) for their VSs built in this compute zone under this bucket (GHz/hour)</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**limit_free_vs_memory**

the amount of RAM users can request for free per hour or per month (depending on selected pricing type) for the total number of their VSs built in this compute zone under this bucket (GB/hour)

**price_allocation_cpu_allocation**

the price per GHz per hour or per month (depending on selected pricing type) for CPU in this compute zone under this bucket (GHz/limit_type)

**price_allocation_cpu_resources_guaranteed**

the price per % per hour or per month (depending on selected pricing type) for CPU resources in this compute zone under this bucket (%/limit_type)

**price_allocation_cpu_used**

the price per GHz per hour or per month (depending on selected pricing type) for used CPU in this compute zone under this bucket (GHz/limit_type)

**price_allocation_memory_allocation**

the price per GB per hour or per month (depending on selected pricing type) for memory in this compute zone under this bucket (GB/limit_type)

**Page History**

v.6.5 Edge 4
- added the following parameters:
  - price_nsxt_edge_gateways
  - limit_free_nsxt_edge_gateways

v.6.3 Edge 1
- added the following parameters:
  - limit_free_allocation_vcpu
  - limit_free_reservation_vcpu
  - limit_free_pay_as_you_go_vcpu
  - price_allocation_vcpu
  - price_reservation_vcpu
  - price_pay_as_you_go_vcpu
3.1.8.4 Delete Resources from Rate Cards for VPC Server Type

If you remove a compute/data store/network/backup server zone from the Rate Card, the prices for the removed resource will be set to zero for the servers using this zone(s).

XML Request Example

```bash
```

JSON Request Example

```bash
```

Where:

**type** - the type of the resource for which configuration is set, it can be one of the following values:

- `compute_zone`
- `data_store_zone`
- `network_zone`
- `backup_server_zone`
- `instance_package`
- `template_group`
- `edge_group`
- `recipe_group`
- `service_addon_group`
- `service_addon_target`
- `orchestration_model`
- `service_addon`
- `template`

**bucket_id** - the ID of the bucket with which this rate card is associated

**server_type** - the server type this rate card is applicable to. In this case vpc.

**target_id** - the ID of the resource which is deleted

3.1.8.5 Get List of Rate Cards for Other Server Type

To get the list of rate cards, use the following request:
GET /billing/buckets/:bucket_id/rate_cards.xml
GET /billing/buckets/:bucket_id/rate_cards.json

XML Request Example

```bash
```

JSON Request Example

```bash
```

XML Output Example

```xml
<rate_cards type="array">
<rate_card>
  <bucket_id type="integer">5263</bucket_id>
  <server_type>other</server_type>
  <target_id type="integer">2</target_id>
  <type>edge_groups_resource</type>
  <timing_strategy>hourly</timing_strategy>
  <target_name>qaOHegF</target_name>
  <prices>
    <price type="decimal">0.0</price>
  </prices>
</rate_card>
<rate_card>...
</rate_cards>
```

Where:

- **bucket_id** - the ID of the bucket with which this rate card is associated.
- **server_type** - the server type this rate card is applicable to. In this case other.
- **target_id** - the ID of the resource for which the prices are set.
- **type** - the type of the resource for which configuration is set. The value can be one of the following:
  - `backup_resource_zone_resource`
  - `edge_groups_resource`
  - `template_resource`
  - `service_addon_resource`
- **timing_strategy** - the type of billing for each resource: hourly or monthly.
target_name - the name of the resource that was added to the bucket. For example, this can be the label of a template.

prices - the array of prices and free limits for the resource that can be the following.

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>backup_resource_zone_resource</td>
<td>price</td>
<td>• The price for a recovery point (backup) per hour.</td>
</tr>
<tr>
<td></td>
<td>price</td>
<td>• The price for a recovery point (backup) size in Gb per hour.</td>
</tr>
<tr>
<td></td>
<td>limit_free</td>
<td>• The number of recovery points (backup/hour) users can store in a backup resource zone for free.</td>
</tr>
<tr>
<td></td>
<td>limit_recovery_point_size_free</td>
<td>• The size of recovery points (Gb/hour) users can consume in a backup resource zone for free.</td>
</tr>
<tr>
<td>edge_groups_resource</td>
<td>price</td>
<td>The price per GB of bandwidth.</td>
</tr>
<tr>
<td>service_addon_resource</td>
<td>price</td>
<td>The price per service add-on per hour.</td>
</tr>
<tr>
<td></td>
<td>price_cpu</td>
<td>The price for the CPU usage per hour per CPU core.</td>
</tr>
<tr>
<td></td>
<td>price_memory</td>
<td>The additional price for RAM per GB per hour.</td>
</tr>
<tr>
<td></td>
<td>price_disk_size</td>
<td>The additional price for disk size per GB per hour.</td>
</tr>
<tr>
<td>template_resource</td>
<td>price</td>
<td>The price per template in a template store.</td>
</tr>
</tbody>
</table>

Page History

v. 6.0
- added the following parameters for a backup_resource_zone_resource type:
  - price_recovery_point_size
  - limit_recovery_point_size_free

v. 5.8
- added the backup_resource_zone_resource type

3.1.8.6 Add Rate Cards for Other Server Type
To add rate cards, use the following request:
POST /billing/buckets/:bucket_id/rate_cards.xml
POST /billing/buckets/:bucket_id/rate_cards.json

XML Request Example
### JSON Request Example

```
curl -i -X POST -u user:userpass --url
http://onapp.test/billing/buckets/321/rate_cards.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"rate_card": {"target_id": 8, "type": "service_addon_groups_resource", "bucket_id": 321, "server_type": "other", "prices": [{"price": 12, "price_cpu": 23, "price_memory": 34, "price_disk_size": 45}]}}'
```

Where:

- **bucket_id** - the ID of the bucket with which this rate card is associated.
- **server_type** - the server type this rate card is applicable to. In this case **other**.
- **target_id** - the ID of the resource for which the prices are set.
- **type** - the type of the resource that is added to the rate card, it can be one of the following values:
  - **backup_resource_zone_resource**
  - **edge_groups_resource**
  - **template_resource**
  - **service_addon_resource**

**prices** - the array of prices and free limits for the resource that can be the following.

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>backup_resource_zone_resource</strong></td>
<td>price</td>
<td>- The price for a recovery point (backup) per hour.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- The price for a recovery point (backup) size in Gb per hour.</td>
</tr>
<tr>
<td></td>
<td>price_recovery_point_size</td>
<td>- The number of recovery points (backup/hour) users can store in a backup resource zone for free.</td>
</tr>
<tr>
<td></td>
<td>limit_free</td>
<td>- The size of recovery points (Gb/hour) users can consume in a backup resource zone for free.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
### Type Parameters Description

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>edge_groups_resource</code></td>
<td><code>price</code></td>
<td>The price per GB of bandwidth.</td>
</tr>
<tr>
<td><code>service_addon_resource</code></td>
<td><code>price</code></td>
<td>The price per service add-on per hour.</td>
</tr>
<tr>
<td></td>
<td><code>price_cpu</code></td>
<td>The price for the CPU usage per hour per CPU core.</td>
</tr>
<tr>
<td></td>
<td><code>price_memory</code></td>
<td>The additional price for RAM per GB per hour.</td>
</tr>
<tr>
<td></td>
<td><code>price_disk_size</code></td>
<td>The additional price for disk size per GB per hour.</td>
</tr>
<tr>
<td><code>template_resource</code></td>
<td><code>price</code></td>
<td>The price per template in a template store.</td>
</tr>
</tbody>
</table>

### Page History

**v. 6.0**
- added the following parameters for a `backup_resource_zone_resource` type:
  - `price_recovery_point_size`
  - `limit_recovery_point_size_free`

**v. 5.8**
- added the `backup_resource_zone_resource` type

### 3.1.8.7 Edit Rate Cards for Other Server Type

To edit rate cards, use the following request:

- **PUT** /billing/buckets/:bucket_id/rate_cards.xml
- **PUT** /billing/buckets/:bucket_id/rate_cards.json

#### XML Request Example

```bash
curl -i -X PUT -u user:userpass --url http://onapp.test/billing/buckets/367/rate_cards.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -d '<?xml version="1.0" encoding="UTF-8"?><rate_card><target_id>7</target_id><type>edge_groups_resource</type><bucket_id>367</bucket_id><server_type>other</server_type><prices><price>0</price><limit_free>-2.22</limit_free></prices></rate_card>'
```

#### JSON Request Example

```bash
curl -i -X PUT -u user:userpass --url http://onapp.test/billing/buckets/367/rate_cards.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"rate_card": {"target_id": 7, "type": "edge_groups_resource", "bucket_id": 367, "server_type": "other", "prices": {"price": 0, "limit_free": -2.22}}}'
```

Where:

- `bucket_id` - the ID of the bucket with which this rate card is associated
- `server_type` - the server type this rate card is applicable to, in this case `other`
**target_id** - the ID of the resource that is added to the rate card

**type** - the type of the resource that is added to the rate card, it can be one of the following values:
- `backup_resource_zone_resource`
- `edge_groups_resource`
- `template_resource`
- `service_addon_groups_resource`

**prices** - the array of prices and free limits for the resource that can be the following.

<table>
<thead>
<tr>
<th>Type</th>
<th>Parameters</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>backup_resource_zone_resource</code></td>
<td><code>price</code></td>
<td>• The price for a recovery point (backup) per hour.</td>
</tr>
<tr>
<td></td>
<td><code>price_recovery_point_size</code></td>
<td>• The price for a recovery point (backup) size in Gb per hour.</td>
</tr>
<tr>
<td></td>
<td><code>limit_free</code></td>
<td>• The number of recovery points (backup/hour) users can store in a backup resource zone for free.</td>
</tr>
<tr>
<td></td>
<td><code>limit_recovery_point_size_free</code></td>
<td>• The size of recovery points (Gb/hour) users can consume in a backup resource zone for free.</td>
</tr>
<tr>
<td><code>edge_groups_resource</code></td>
<td><code>price</code></td>
<td>The price per GB of bandwidth.</td>
</tr>
<tr>
<td><code>service_addon_resource</code></td>
<td><code>price</code></td>
<td>The price per service add-on per hour.</td>
</tr>
<tr>
<td></td>
<td><code>price_cpu</code></td>
<td>The price for the CPU usage per hour per CPU core.</td>
</tr>
<tr>
<td></td>
<td><code>price_memory</code></td>
<td>The additional price for RAM per GB per hour.</td>
</tr>
<tr>
<td></td>
<td><code>price_disk_size</code></td>
<td>The additional price for disk size per GB per hour.</td>
</tr>
<tr>
<td><code>template_resource</code></td>
<td><code>price</code></td>
<td>The price per template in a template store.</td>
</tr>
</tbody>
</table>

**Page History**

v. 6.0
- added the following parameters for a `backup_resource_zone_resource` type:
  - `price_recovery_point_size`
  - `limit_recovery_point_size_free`

v. 5.8
• added the backup_resource_zone_resource type

3.1.8.8 Delete Resource from Rate Card for Other Server Type
To delete resources from the rate card, use the following request:
DELETE /billing/buckets/:bucket_id/rate_cards.xml
DELETE /billing/buckets/:bucket_id/rate_cards.json

XML Request Example

```bash
curl -L -X DELETE -u user:userpass --url
'<?xml version="1.0" encoding="UTF-8"?>
<rate_card><type>template_groups_resource</type><bucket_id>308</bucket_id><server_type>other</server_type><target_id>1</target_id></rate_card>'
```

JSON Request Example

```bash
curl -L -X DELETE -u user:userpass --url
http://onapp.test/billing/buckets/308/rate_cards/delete.json -H 'Accept: application/json' -H 'Content-type: application/json' -d "{"rate_card": {"type": "template_groups_resource", "bucket_id": 308, "server_type": "other", "target_id": 1}}"
```

Where:

type - the type of the resource for which configuration is set, it can be one of the following values:
• backup_resource_zone_resource
• edge_groups_resource
• template_groups_resource
• service_addon_groups_resource

bucket_id - the ID of the bucket with which this access control is associated
server_type - the server type this access control is applicable to. In this case other.
target_id - the ID of the resource which is deleted

3.2 Catalogs API

This section provides the API calls you can use to manage catalogs imported from VMware Cloud Director.

3.2.1 Get List of Catalogs
To view the list of catalogs, use the following request:
GET /catalogs.xml
GET /catalogs.json

XML Request Example
### JSON Request Example

```
```

### XML Output Example

```
<vcloud_catalogs type="array">
  <vcloud_catalog>
    <user_id>null</user_id>
    <hypervisor_id>4</hypervisor_id>
    <created_at>2016-02-01T11:43:52+00:00</created_at>
    <updated_at>2016-02-01T11:43:52+00:00</updated_at>
    <label>vn-onapp-public8</label>
    <published>true</published>
    <organization_id>11</organization_id>
    <identifier>a6d6d29a-e8eb-4869-a9af-53a5ec9b792c</identifier>
    <id>8</id>
    <description>This is a description of a catalog</description>
    <data_store_id>18</data_store_id>
  </vcloud_catalog>
  <vcloud_catalog>...</vcloud_catalog>
</vcloud_catalogs>
```

Where:

- **user_id** - the owner ID
- **hypervisor_id** - the ID of the compute resource
- **created_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **label** - the name of the catalog
- **published** - true if catalog is published, otherwise, false
- **organization_id** - the ID of the organisation, to which the catalog is assigned
- **identifier** - the identifier of the catalog
- **id** - the ID of the catalog
- **description** - the description of the catalog
- **data_store_id** - the ID of a data store used by the catalog

### 3.2.2 Get Catalog Details

To view the details of catalog, use the following request:

```
GET /catalogs/:id.xml
GET /catalogs/:id.json
```

### XML Request Example
JSON Request Example

XML Output Example

```xml
<vcloud_catalogs type="array">
  <vcloud_catalog>
    <user_id>null</user_id>
    <hypervisor_id>4</hypervisor_id>
    <created_at>2016-02-01T11:43:52+00:00</created_at>
    <updated_at>2016-02-01T11:43:52+00:00</updated_at>
    <label>vn-onapp-public8</label>
    <published>true</published>
    <organization_id>11</organization_id>
    <identifier>a6d6d29a-e8eb-4869-a9af-53a5ec9b792c</identifier>
    <id>8</id>
    <description>This is a description of a catalog</description>
    <data_store_id>18</data_store_id>
  </vcloud_catalog>
</vcloud_catalogs>
```

Where:
- **user_id** - the owner ID
- **hypervisor_id** - the ID of the compute resource
- **created_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- **updated_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- **label** - the name of the catalog
- **published** - true if catalog is published, otherwise, false
- **organization_id** - the ID of the organisation, to which the catalog is assigned
- **identifier** - the identifier of the catalog
- **id** - the ID of the catalog
- **description** - the description of the catalog
- **data_store_id** - the ID of a data store used by the catalog

### 3.2.3 Create Catalog

To create a catalog, use the following request:

POST /catalogs.xml

POST /catalogs.json

XML Request Example

**JSON Request Example**

curl -i -X POST -u user:userpass --url http://onapp.test/catalogs.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"vcloud_catalog": {"organization_id": "11", "data_store_id": "9", "vdc_id": "6", "label": "TestCatalog", "description": "This is a description of a catalog"}}'

Where:

- **organization_id** - the ID of the organisation, to which the catalog will be assigned
- **data_store_id** - the ID of the data store, to which the catalog will be assigned
- **vdc_id** - the ID of the resource pool, to which the catalog will be assigned
- **label** - the name of the catalog
- **description** - the description of the catalog

### 3.2.4 Edit Catalog

To edit a catalog, use the following request:

PUT /catalogs/:id.xml

PUT /catalogs/:id.json

**XML Request Example**

**JSON Request Example**

Where:

- **label** - the name of the catalog
- **description** - the description of catalog
3.2.5 Add vApp to Catalog

Ensure that FullControl or Change access rights for a user or group are applied to the Catalog at the vCloud side before adding vApp to catalog. For more information, refer to Access Rights to VMware Cloud Director Objects.

To add a vApp to catalog, use the following request:

POST /vapps/:vapp_id/conversion.xml
POST /vapps/:vapp_id/conversion.json

XML Request Example

```
```

JSON Request Example

```
curl -i -X POST -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/vapps/12/conversion.json -d '{"vcloud_vapp_template":{"catalog":"1","overwrite_catalog_item":"1","label":"vApp_system_111","description":"test","target_vapp_template":"1"}}'
```

Where:

catalog - choose the catalog to which the vApp will be added.

overwrite-catalog-item - set "1" to save this vApp as a template instead of another vApp template, otherwise set "0".

label - specify the name of the vApp. This parameter is applicable only when the overwrite-catalog-item parameter is set to "0".

description - add the appropriate vApp description.

target-vapp-template - choose the appropriate vApp template, which will be replaced. This parameter is applicable only when the overwrite-catalog-item parameter is set to "1".

3.2.6 Delete Catalog

To delete a catalog, use the following request:

DELETE /catalogs/:id.xml
DELETE /catalogs/:id.json

XML Request Example
3.2.7 Get List of vApp Templates

To view the list of vApp templates, use the following request:
GET/catalogs/:id/vapp_templates.xml
GET/catalogs/:id/vapp_templates.json

XML Request Example

curl -i -X GET -u user:userpass --url
http://onapp.test/catalogs/12/vapp_templates.xml -H 'Accept: application/xml' -H 'Content-type: application/xml'

JSON Request Example

curl -i -X GET -u user:userpass --url
http://onapp.test/catalogs/12/vapp_templates.json -H 'Accept: application/json' -H 'Content-type: application/json'

XML Output Example
<vcloud_vapp_templates type="array">
  <vcloud_vapp_template>
    <id type="integer">16</id>
    <identifier>vappTemplate-1a1fd44-3e72-4add-8810-89d90e2c8bc6</identifier>

          <use_org_settings type="boolean">false</use_org_settings>
          <admin_password_enabled type="boolean">true</admin_password_enabled>
          <admin_password_auto type="Boolean">true</admin_password_auto>
          <admin_password nil="true"/>
          <admin_auto_logon_enabled type="boolean">false</admin_auto_logon_enabled>
          <admin_auto_logon_count type="integer">0</admin_auto_logon_count>
        </guest_customization>
      </virtual_machine>
    </virtual_machines>
    <catalog_item_id type="integer">18</catalog_item_id>
    <description>Description</description>
  </vcloud_vapp_template>
</vcloud_vapp_templates>

Where:

id - ID of the vApp template
identifier - the identifier of the vApp template
label - the name of the vApp template
created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
virtual_machines - the array of virtual servers that are built from the template
temporary_vms - the array of the virtual server parameters

identifier - the identifier of the virtual server
name - the name of the virtual server
disks - the array of the virtual server disks
disk - the array of the disk parameters
instance_id - the ID of the disk
label - the label of the disk
capacity - the capacity of the disk in GB
bus_type - the bus type of the disk
bus_sub_type - the bus sub type of the disk
nics - the array of the virtual server NICs
nic - the array of the NIC parameters

adapter_type - the network adapter type provided for the VS
cpus - the number of allocated CPU cores
cores_per_socket - the number of cores per socket
memory - the number of RAM allocated to the VS
operating_system - the operating system used by the VS
vmware_tools - the ID of the VMware tools
guest_customization - the array of the guest customization parameters applied to the VS.
The guest customization is available only for virtual servers with the VMware tools.

enabled - true, if the guest customization is enabled, otherwise, false
change_sid - true, if Change SID is enabled, otherwise, false. This parameter is applicable only for Windows VSs and runs Sysprep to change Windows SID. On Windows NT, VCD uses Sidgen. Running sysprep is a prerequisite for completing domain join.
join_domain_enabled - true, if the VS is enabled to join a domain, otherwise, false
use_org_settings - true, if the user org settings are enabled, otherwise, false
admin_password_enabled - true, if the local administrator password is enabled, otherwise, false
admin_password_auto - true, if the administrator password is generated automatically, otherwise, false
admin_password - the password of the administrator
admin_auto_logon_enabled - true, if the administrator can be automatically logged in to the VS. This parameter applies only to Windows VSs.
admin_auto_logon_count - the number of automatic logins available for the administrator. After the indicated time is exceeded and you are not able to log in, the VS remains running and you need to enter your credentials. This option applies only if the admin_auto_logon_enabled is true.
reset_password_required - true, if the administrator is required to change the password on a first login to the VS, otherwise, false
computer_name - the VS computer name
script - the script for the guest customization
**catalog_item_id** - the ID of the catalog

*description* - the description of the vApp template

**Page History**

v. 6.0

- added the following parameters:
  - virtual_machines array
  - description

### 3.2.8 Get List of Media Files

To view the list of Media files, use the following request:

GET/catalogs/:id/media.xml

GET/catalogs/:id/media.json

**XML Request Example**

```
curl -i -X GET -u user:userpass --url
   http://onapp.test/catalogs/12/media.xml
   -H 'Accept: application/xml'
   -H 'Content-type: application/xml'
```

**JSON Request Example**

```
curl -i -X GET -u user:userpass --url
   http://onapp.test/catalogs/12/media.json
   -H 'Accept: application/json'
   -H 'Content-type: application/json'
```

**XML Output Example**

```
<vcloud_media type="array">
  <vcloud_media>
    <status>1</status>
    <user_id>null</user_id>
    <description>test</description>
    <data_store_id>2</data_store_id>
    <image_type>iso</image_type>
    <created_at>2016-02-04T14:19:26+02:00</created_at>
    <updated_at>2016-02-04T14:19:26+02:00</updated_at>
    <label>Kostya000</label>
    <catalog_item_id>3</catalog_item_id>
    <identifier>667d99d-a3af-40d0-aa4a-907b41ab2559</identifier>
    <vdc_id>1</vdc_id>
    <id>1</id>
    <size>414187520</size>
  </vcloud_media>
  ...<vcloud_media>
</vcloud_media>
```

**Where:**

*status* - the status of media file

*user_id* - owner ID
**3.2.9 Add File to Media Library**

To add a file to media library, take the following steps:

1. Upload file to the Control Panel
2. Add file to the media library of a specific catalog

### 3.2.9.1 File uploading to the Control Panel

To upload file to the Control Panel, use the following request:

**POST /catalogs/upload_files**

**Request Example**

```bash
```

Where:

- `vcloud_media[folder]` - path, where the media file is stored

### 3.2.9.2 Adding a file to the media library

To add a file to the media library, use the following request:

**POST /catalogs/:id/media.xml**

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
curl -i -X POST -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/catalogs/12/media.json -d '{"vcloud_media": {"label": "Media", "folder": "path"}}'
```
curl -i -X POST -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/catalogs/12/media.json -d '{"vcloud_media":{"label":"Media","folder":"path"}}'

Where:

*label* - the name of the media file

*folder* - path, where the media file is situated (the same folder, as indicated during file uploading to the Control Panel)

### 3.2.10 Create vApp Template (Add to Catalog)

To create a vApp template, use the following request:

**POST /catalogs/:id/vapp_templates.xml**

**POST /catalogs/:id/vapp_templates.json**

**XML Request Example**

```
```

**JSON Request Example**

```
curl -i -X POST -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/catalogs/12/vapp_templates.json -d '{"vcloud_vapp_template":{"label":"Template","ovf_url":"url"}}'
```

Where:

*label* - the name of the vApp template

*ovf_url* - the link to the vApp template

or

*folder* - path, where the vApp template is situated

### 3.2.11 Delete vApp Template

To delete a vApp template, use the following request:

**DELETE /catalogs/:id/vapp_templates/:id.xml**

**DELETE /catalogs/:id/vapp_templates/:id.xml**

**XML Request Example**

```
```

**JSON Request Example**
3.3 Company Billing Plans API

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.1 Get List of Company Billing Plans

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.2 Get Company Billing Plan Details

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.3 Get Company Billing Plan Resources

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.4 Get Company Billing Plan Resource Details

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.
3.3.5 Create Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the **Buckets API** section of this guide.

3.3.6 Add Limits for Compute Zone

The API requests in this section are deprecated in this version. For the new API requests refer to the **Buckets API** section of this guide.

3.3.7 Add Limits for Data Store Zones

The API requests in this section are deprecated in this version. For the new API requests refer to the **Buckets API** section of this guide.

3.3.8 Add Limits for Network Zone

The API requests in this section are deprecated in this version. For the new API requests refer to the **Buckets API** section of this guide.

3.3.9 Edit Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the **Buckets API** section of this guide.

3.3.10 Edit Limits & Pricing for Data Store Zones in Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the **Buckets API** section of this guide.
3.3.11 Edit Limits & Pricing for Network Zones in Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.12 Edit Limits & Pricing for Compute Zones in Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.13 Delete Resource From Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.3.14 Delete Company Billing Plan

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.4 Company Payments API

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.4.1 Get List of Company Payments

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.
3.4.2 Get List of Company Monthly Bills

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.4.3 Create Company Payment

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.4.4 Edit Company Payment

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.4.5 Delete Company Payment

The API requests in this section are deprecated in this version. For the new API requests refer to the Buckets API section of this guide.

3.5 External Networks API

This section provides the API calls you can use to manage external networks imported from vCloud.

3.5.1 Get List of vCloud External Networks

To view the list of external networks, use the following request:

GET /settings/external_networks.xml
GET /settings/external_networks.json

XML Request Example

```
```

JSON Request Example

XML Output Example

```xml
<external_networks type="array">
  <external_network>
    <created_at type="datetime">2016-02-13T10:31:06+02:00</created_at>
    <default_nat_rule_number type="integer">9999</default_nat_rule_number>
    <default_outside_ip_address_id nil="true"/>
    <dvportgroup>dvportgroup-33</dvportgroup>
    <enabled type="boolean">false</enabled>
    <dns_suffix nil="true"/>
    <gateway>172.16.0.254</gateway>
    <id type="integer">1</id>
    <identifier>32ee56a-799b-4a2e-a3c3-b663c24c43c5</identifier>
    <ip_address_pool_id nil="true"/>
    <is_nated type="boolean">true</is_nated>
    <label>External Net</label>
    <netmask>255.255.255.0</netmask>
    <network_group_id type="integer">12</network_group_id>
    <prefix_size nil="true"/>
    <primary_dns nil="true"/>
    <secondary_dns nil="true"/>
    <shared type="boolean">false</shared>
    <updated_at type="datetime">2016-02-13T10:31:06+02:00</updated_at>
    <user_id nil="true"/>
    <vapp_id nil="true"/>
    <vdc_id nil="true"/>
    <vlan nil="true"/>
  </external_network>
  ...
</external_networks>
```

Where:

- `created_at` - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- `default_nat_rule_number` - default NAT rule
- `default_outside_ip_address_id` - ID of the outside IP address
- `dns_suffix` - the DNS suffix
- `dvportgroup` - the portgroup that backs this network
- `enabled` - whether the network is enabled or not
- `fence_mode` - isolation type of the network
- `gateway` - the gateway associated with the network
- `id` - the ID of the network
- `identifier` - the identifier of the network
- `ip_address_pool_id` - ID of the IP Address Pool
- `is_nated` - set true to use NAT for translating the traffic. Set false if you are using your own firewall with external IP address
- `label` - the name of the network
- `netmask` - IP of the network mask
3.5.2 Get vCloud External Network Details

To view the details of an external network, use the following request:

GET /settings/external_networks/:id.xml
GET /settings/external_networks/:id.json

**XML Request example:**
```
```

**JSON Request example:**
```
```

**XML Output example:**
<external_network>
  <id type="integer">3</id>
  <label>Network 3234</label>
  <identifier>asdf0000000004</identifier>
  <created_at type="dateTime">2021-08-19T09:16:38Z</created_at>
  <updated_at type="dateTime">2021-08-19T09:16:38Z</updated_at>
  <network_group_id nil="true"/>
  <type>Networking::VCloud::ExternalNetwork</type>
  <user_id nil="true"/>
  <ip_address_pool_id nil="true"/>
  <default_outside_ip_address_id nil="true"/>
  <default_nat_rule_number type="integer">9999</default_nat_rule_number>
  <prefix_size nil="true"/>
  <is_nated type="boolean">false</is_nated>
  <vapp_id nil="true"/>
  <default_outside_ip_address_id nil="true"/>
  <is_nated type="boolean">false</is_nated>
  <gateway nil="true"/>
  <netmask nil="true"/>
  <primary_dns nil="true"/>
  <secondary_dns nil="true"/>
  <shared type="boolean">false</shared>
  <fence_mode nil="true"/>
  <vcenter_identifier nil="true"/>
  <parent_network_id nil="true"/>
  <openstack_id nil="true"/>
  <dv_switch_id nil="true"/>
  <vdc_group_id nil="true"/>
  <universal_router_id nil="true"/>
  <backing_type>standart</backing_type>
  <ip_nets type="array">
    <ip_net>
      <cidr>69.168.237.0/24</cidr>
      <default_gateway>69.168.237.253</default_gateway>
      <ip_ranges type="array">
        <ip_range>
          <start_address>69.168.237.150</start_address>
          <end_address>69.168.237.190</end_address>
          <used_addresses type="array">
            <used_address>
              <ip_address>192.168.0.7</ip_address>
              <assigned nil="true"/>
              <virtual_server type="array"/>
            </used_address>
          </used_addresses>
        </ip_range>
      </ip_ranges>
    </ip_net>
    <ip_net>
      <cidr>10.0.23.0/24</cidr>
      <default_gateway nil="true"/>
      <ip_ranges type="array">
        <ip_range>
          <start_address>10.0.23.1</start_address>
          <end_address>10.0.23.11</end_address>
          <used_addresses type="array">
            <used_address>
              <ip_address>192.168.0.7</ip_address>
              <assigned nil="true"/>
              <virtual_server type="array"/>
            </used_address>
          </used_addresses>
        </ip_range>
      </ip_ranges>
    </ip_net>
  </ip_nets>
</external_network>

Where:
id - the ID of the network
label - the label of network
identifier - the identifier of the network
created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
vlan - VLAN number
network_group_id - network zone ID
user_id - owner ID
ip_address_pool_id - the ID of the IP Address Pool
default_outside_ip_address_id - ID of the outside IP address
default_nat_rule_number - number of default NAT rule
prefix_size - subnet prefix size
is_nated - true if NAT is using for translating the traffic, false if you are using your own firewall with an external IP address
vapp_id - the vApp associated with the network
vdc_id - the resource pool associated with the network
enabled - true if the network is enabled, otherwise false
gateway - the gateway associated with the network
netmask - IP of the network mask
primary_dns - IP address of the primary domain name system (DNS) server
secondary_dns - IP address of the secondary domain name system (DNS) server
dns_suffix - the DNS suffix
shared - true if the external network is shared, otherwise not
fence_mode - isolation type of the network
vcenter_identifier - vCenter identifier for external network
parent_network_id - parent network ID
openstack_id - Openstack ID
dv_switch_id - DV Switch ID
vdc_group_id - VDC (resource pool) group ID
universal_router_id - universal router ID
backing_type - backing type, can be standard or nsxt
ip_nets - array of IP nets

cidr - CIDR
default_gateway - default gateway for IP net
ip_ranges - an array of IP addresses within the network
start_address - start address of IP range
done, end_address - end address of IP range
used_addresses - the array of used addresses
ip_address - used IP address
assigned - true if IP addresses are assigned to VS, otherwise false
virtual_server - the virtual servers to which IP addresses are assigned

Page History
v.6.6 Edge 4
added the following
parameters: vcenter_identifier, parent_network_id, openstack_id, dv_switch_id, vdc_group_id, universal_router_id, backing_type, ip_nets, cidr, default_gateway, ip_ranges, start_address, end_address, used_addresses, ip_address, assigned, virtual_server.

3.5.3 Get List of IP Addresses Assigned to vCloud External Network
To get the list of IP addresses assigned to the external network, use the following request:

GET /settings/external_networks/:id/ip_addresses.xml
GET /settings/external_networks/:id/ip_addresses.json

XML Request Example
curl -i -X GET -u 'user:userpass' --url
http://onapp.test/settings/external_networks/1/ip_addresses.xml -H
'Accept: application/xml' -H 'Content-type: application/xml'

JSON Request Example

curl -i -X GET -u 'user:userpass' --url
http://onapp.test/settings/external_networks/1/ip_addresses.json -H
'Accept: application/json' -H 'Content-type: application/json'

XML Output Example

```xml
<ip_addresses type="array">
    <ip_address>
        <address>172.16.0.1</address>
        <broadcast nil="true"/>
        <created_at type="datetime">2016-02-13T10:31:06+02:00</created_at>
        <customer_network_id nil="true"/>
        <disallowed_primary type="boolean">false</disallowed_primary>
        <gateway>172.16.0.254</gateway>
        <hypervisor_id nil="true"/>
        <id type="integer">1</id>
        <ip_address_pool_id nil="true"/>
        <network_address nil="true"/>
        <network_id type="integer">1</network_id>
        <pxe type="boolean">false</pxe>
        <updated_at type="datetime">2016-02-13T10:31:06+02:00</updated_at>
        <user_id nil="true"/>
        <free type="boolean">false</free>
        <netmask>255.255.255.0</netmask>
    </ip_address>
    ...
</ip_addresses>
```

Where:
address - the IP address assigned to the external network
broadcast - the broadcast address
created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
customer_network_id - the ID of the customer network
disallowed_primary - true if not allowed to be used as primary (for VS build), otherwise false
gateway - the gateway associated with the network
hypervisor_id - the ID of the compute resource the IP address is associated with
id - the ID of the network
ip_address_pool_id - ID of the IP Address Pool
network_address - the address of the network
network_id - the ID of the network
pxe - true, if this compute resource address can be used for cloudbooting a compute resource
updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
user_id - owner ID
free - true if free, otherwise false
netmask - IP of the network mask

3.6 Firewall Rules API

This section provides the API calls you can use to manage firewall rules.

3.6.1 Get List of vCloud Firewall Rules

To view the list of firewall rules, use the following request:

GET /firewall_services/:firewall_service_id/firewall_rules.xml
GET /firewall_services/:firewall_service_id/firewall_rules.json

XML Request Example

JSON Request Example

curl -i -X GET http://onapp.test/firewall_services/4/firewall_rules.json
-u user:userpass

XML Output Example

<firewall_rules type="array">
  <firewall_rule>
    <address>internal</address>
    <command>ACCEPT</command>
    <created_at type="datetime">2015-07-20T12:30:18+00:00</created_at>
    <description>VMs' internet 80</description>
    <destination_ip type="integer">4</destination_ip>
    <enable_logging type="boolean">false</enable_logging>
    <enabled type="boolean">true</enabled>
    <firewall_service_id type="integer">4</firewall_service_id>
    <id type="integer">16</id>
    <identifier>1</identifier>
    <network_interface_id nil="true"/>
    <port>80</port>
    <position type="integer">1</position>
    <protocol>TCP</protocol>
    <source_port>-1</source_port>
    <updated_at type="datetime">2015-07-20T12:30:18+00:00</updated_at>
  </firewall_rule>
  ...<firewall_rule>
</firewall_rules>

Where:
address - the traffic source IP address for which this rule is active
command - the command to ACCEPT or DROP the indicated IPs
created_at - the date when the record in DB was created
description - the description of the firewall rule
destination_ip - the traffic destination IP address for which this rule is active
enable_lo\ngging - ‘true’ if the system will log when the rule drops or accepts traffic
enabled - whether the firewall rule is enabled or not
firewall_service_id - the ID of the firewall service with which the rule is associated
id - the ID of the firewall rule
identifier - identifier of the firewall rule
network_interface_id - the ID of a network interface for which this rule is active
port - the traffic destination port for which this rule is active
position - the rule priority
protocol - protocol type (TCP or UDP)
source_port - the traffic source port for which this rule is active
updated_at - the date when the record was updated in DB

3.6.2 Get Firewall Rule Details
To view the list of firewall rules, use the following request:
GET /firewall_services/:firewall_service_id/firewall_rules/:id.xml
GET /firewall_services/:firewall_service_id/firewall_rules/:id.json

XML Request Example
```
-u user:userpass
```

JSON Request Example
```
curl -i -X GET
-u user:userpass
```

XML Output Example
```
<vcloud_firewall_rule>
  <address>internal</address>
  <command>ACCEPT</command>
  <created_at type="datetime">2015-07-20T12:30:18+00:00</created_at>
  <description>VMs’ internet 80</description>
  <destination_ip>external</destination_ip>
  <enable_logging type="boolean">false</enable_logging>
  <enabled type="boolean">true</enabled>
  <firewall_service_id type="integer">4</firewall_service_id>
  <id type="integer">16</id>
  <identifier>1</identifier>
  <network_interface_id nil="true"/>
  <port>80</port>
  <position type="integer">1</position>
  <protocol>TCP</protocol>
  <source_port>-1</source_port>
  <updated_at type="datetime">2015-07-20T12:30:18+00:00</updated_at>
</vcloud_firewall_rule>
```

Where:
address - the traffic source IP address for which this rule is active
command - the command to ACCEPT or DROP the indicated IPs
created_at - the date when the record in DB was created
description - the description of the firewall rule
destination_ip - the traffic destination IP address for which this rule is active
enable_logging - 'true' if the system will log when the rule drops or accepts traffic
enabled - whether the firewall rule is enabled or not
firewall_service_id - the ID of the firewall service with which the rule is associated
id - the ID of the firewall rule
identifier - identifier of the firewall rule
network_interface_id - the ID of a network interface for which this rule is active
port - the traffic destination port for which this rule is active
position - the rule priority
protocol - protocol type (TCP or UDP)
source_port - the traffic source port for which this rule is active
updated_at - the date when the record was updated in DB

3.6.3 Create vCloud Firewall Rule
To create a firewall rule, use the following request:
POST /firewall_services/:firewall_service_id/firewall_rules.xml
POST /firewall_services/:firewall_service_id/firewall_rules.json

XML Request Example
```xml
curl -i -X POST http://onapp.test/firewall_services/12/firewall_rules.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<vcloud_firewall_rule><enabled>1</enabled><description>Description</description><command>ACCEPT</command><address>0.0.0.0</address><source_port>80</source_port><destination_ip>0.0.0.0</destination_ip><port>80</port><protocol>TCP</protocol><enable_logging>0</enable_logging></vcloud_firewall_rule>'
```

JSON Request Example
```json
curl -i -X POST http://onapp.test/firewall_services/12/firewall_rules.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"vcloud_firewall_rule":{"enabled":"1","description":"Description","command":"ACCEPT","address":"0.0.0.0","source_port":"80","destination_ip":"0.0.0.0","port":"80","protocol":"TCP","enable_logging":"0"},"firewall_service_id":"2"}'
```

Where:
description - fill in the description of the firewall rule
enabled - set the "enabled" as 1 if you want the firewall rule to be enabled, or 0 if you want it to be disabled
command - sets the command to ACCEPT or DROP the indicated IPs
address - set the traffic source IP address for which this rule is active
  • Enter 'any' to apply this rule to all IPs
  • Enter hyphen-separated IPs to apply the rule to an IP range (e.g. 192.168.1.1-192.168.1.10)
  • Enter the IPs with slash to apply the rule to CIDR (e.g. 192.168.1.1/24)
  • Enter 'internal' to apply the rule to IP address from the current network
  • Enter 'external' to apply the rule to IP address outside the current network
source_port - set the traffic source port for which this rule is active
- Enter colon-separated ports to apply the rule to a port range (e.g. 1024:1028)
- Enter 'any' to apply the rule to all ports

destination_ip - set the traffic destination IP address for which this rule is active
- Enter 'any' to apply this rule to all IPs
- Enter hyphen-separated IPs to apply the rule to an IP range (e.g. 192.168.1.1-192.168.1.10)
- Enter the IPs with slash to apply the rule to CIDR (e.g. 192.168.1.1/24)
- Enter 'internal' to apply the rule to IP address from the current network
- Enter 'external' to apply the rule to IP address outside the current network

port - set the traffic destination port for which this rule is active
- Enter colon-separated ports to apply the rule to a port range (e.g. 1024:1028)
- Enter 'any' to apply the rule to all ports

protocol - protocol type (TCP or UDP)

enable_logging - set to 'true' if you want the system to log when the rule drops or accepts traffic

3.6.4 Edit vCloud Firewall Rules
To edit a firewall rule, use the following request:
```plaintext
PUT /firewall_services/:firewall_service_id/firewall_rules/:id.xml
```
```plaintext
PUT /firewall_services/:firewall_service_id/firewall_rules/:id.json
```

XML Request Example
```plaintext
curl -i -X PUT http://onapp.test/firewall_services/12/firewall_rules/1.xml
-H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d
'<?xml version="1.0" encoding="utf-8"?>
<enabled>1</enabled><description>ICMP</description>
<command>ACCEPT</command><address>internal</address><source_port>1</source_port><destination_ip>external</destination_ip><port/><protocol>ICMP</protocol><enable_logging>0</enable_logging></vcloud_firewall_rule>"
```

JSON Request Example
```plaintext
curl -i -X PUT
http://onapp.test/firewall_services/12/firewall_rules/1.json
-H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d
'{"vcloud_firewall_rule":{"enabled":"1","description":"ICMP","command":"ACCEPT","address":"internal","source_port":"1","destination_ip":"external","port":"","protocol":"ICMP","enable_logging":"0"},"firewall_service_id":"2","id":"4"}'
```

Where:
enabled - set the "enabled" as 1 if you want the firewall rule to be enabled, or 0 if you want it to be disabled
description - fill in the description of the firewall rule
command - set the command to ACCEPT or DROP the indicated IPs
address - set the traffic source IP address for which this rule is active
  - Enter 'any' to apply this rule to all IPs
  - Enter hyphen-separated IPs to apply the rule to an IP range (e.g. 192.168.1.1-192.168.1.10)
  - Enter the IPs with slash to apply the rule to CIDR (e.g. 192.168.1.1/24)
  - Enter 'internal' to apply the rule to IP address from the current network
  - Enter 'external' to apply the rule to IP address outside the current network

source_port - set the traffic source port for which this rule is active
  - Enter colon-separated ports to apply the rule to a port range (e.g. 1024:1028)
  - Enter 'any' to apply the rule to all ports

destination_ip - set the traffic destination IP address for which this rule is active
  - Enter 'any' to apply this rule to all IPs
  - Enter hyphen-separated IPs to apply the rule to an IP range (e.g. 192.168.1.1-192.168.1.10)
  - Enter the IPs with slash to apply the rule to CIDR (e.g. 192.168.1.1/24)
  - Enter 'internal' to apply the rule to IP address from the current network
  - Enter 'external' to apply the rule to IP address outside the current network

port - set the traffic destination port for which this rule is active
  - Enter colon-separated ports to apply the rule to a port range (e.g. 1024:1028)
  - Enter 'any' to apply the rule to all ports

protocol - protocol type (TCP or UDP)

enable_logging - set to 'true' if you want the system to log when the rule drops or accepts traffic

### 3.6.5 Delete vCloud Firewall Rule

To delete a firewall rule, use the following request:

```
DELETE /firewall_services/:firewall_service_id/firewall_rules/:id.xml
DELETE /firewall_services/:firewall_service_id/firewall_rules/:id.json
```

**XML Request Example**

```
curl -i -X DELETE
http://onapp.test/firewall_services/12/firewall_rules/1.xml -u
user:userpass
```

**JSON Request Example**

```
curl -i -X DELETE
http://onapp.test/firewall_services/12/firewall_rules/1.json -u
user:userpass
```
3.7 Network Interfaces API

This section provides the API calls you can use to manage network interfaces imported from vCloud.

3.7.1 Get List of vCloud Network Interfaces

To view the list of network interfaces, use the following request:

GET /virtual_machines/:virtual_server_id/network_interfaces.xml
GET /virtual_machines/:virtual_server_id/network_interfaces.json

XML Request Example

curl -i -X GET http://onapp.test/virtual_machines/157/network_interfaces.xml -u user:userpass

JSON Request Example

curl -i -X GET http://onapp.test/virtual_machines/157/network_interfaces.json -u user:userpass

XML Output Example

```xml
<network_interfaces type="array">
  <vcloud_network_interface>
    <connected type="boolean">true</connected>
    <created_at type="datetime">2015-07-20T13:54:31+00:00</created_at>
    <default_firewall_rule>ACCEPT</default_firewall_rule>
    <id type="integer">5</id>
    <identifier>moq2607eyhz8vo</identifier>
    <label>Network adapter 0</label>
    <mac_address>00:50:56:01:01:1c</mac_address>
    <network_join_id type="integer">13</network_join_id>
    <primary type="boolean">true</primary>
    <rate_limit type="integer">0</rate_limit>
    <updated_at type="datetime">2015-07-20T13:54:31+00:00</updated_at>
    <usage nil="true"/>
    <usage_last_reset_at nil="true"/>
    <usage_month_rolled_at nil="true"/>
    <virtual_machine_id type="integer">157</virtual_machine_id>
    <adapter_type>VMXNET3</adapter_type>
  </vcloud_network_interface>
  ...</vcloud_network_interface>
</network_interfaces>
```

Where:

- **connected** - whether the network interface is connected to the VS or not
- **created_at** - the timestamp in the database when this network interface was created
- **default_firewall_rule** - not relevant to network interfaces
- **id** - the ID of this network interface
- **identifier** - the identifier in the database of this network interface
label - network interface name
mac_address - network interface MAC address
network_join_id - the ID of the network join to which this network interface belongs
primary - true if this network interface is primary, otherwise false
rate_limit - port speed in Mbps
updated_at - the timestamp in the database when this network interface was updated
usage - not relevant to network interfaces
usage_last_reset_at - not relevant to network interfaces
usage_month_rolled_at - not relevant to network interfaces
virtual_machine_id - the ID of a virtual server to which this network interface is attached
adapter_type - the network adapter type provided for the VS that can be one of the following values:
  • Vlance
  • E1000
  • E1000E
  • VMXNET
  • VMXNET2
  • VMXNET3
  • FLEXIBLE

3.7.2 Get vCloud Network Interface Details

To view the details of a network interface, use the following request:
GET /virtual_machines/:virtual_server_id/network_interfaces/:id.xml
GET /virtual_machines/:virtual_server_id/network_interfaces/:id.json

XML Request Example

```
curl -i -X GET
http://onapp.test/virtual_machines/157/network_interfaces/5.xml -u
user:userpass
```

JSON Request Example

```
curl -i -X GET
http://onapp.test/virtual_machines/157/network_interfaces/5.json -u
user:userpass
```

XML Output Example

```xml
```
<network_interfaces type="array">
    <vcloud_network_interface>
        <connected type="boolean">true</connected>
        <created_at type="datetime">2015-07-20T13:54:31+00:00</created_at>
        <default_firewall_rule>ACCEPT</default_firewall_rule>
        <id type="integer">5</id>
        <identifier>moq2607eyhz8vo</identifier>
        <label>Network adapter 0</label>
        <mac_address>00:50:56:01:01:1c</mac_address>
        <network_join_id type="integer">13</network_join_id>
        <primary type="boolean">true</primary>
        <rate_limit type="integer">0</rate_limit>
        <updated_at type="datetime">2015-07-20T13:54:31+00:00</updated_at>
        <usage nil="true"/>
        <usage_last_reset_at nil="true"/>
        <usage_month_rolled_at nil="true"/>
        <virtual_machine_id type="integer">157</virtual_machine_id>
        <adapter_type>VMXNET3</adapter_type>
    </vcloud_network_interface>
</network_interfaces>

Where:

connected - whether the network interface is connected to the VS or not
created_at - the timestamp in the database when this network interface was created
default_firewall_rule - not relevant to network interfaces
id - the ID of this network interface
identifier - the identifier in the database of this network interface
label - network interface name
mac_address - network interface MAC address
network_join_id - the ID of the network join to which this network interface belongs
primary - true if this network interface is primary, otherwise false
rate_limit - port speed in Mbps
updated_at - the timestamp in the database when this network interface was updated
usage - not relevant to network interfaces
usage_last_reset_at - not relevant to network interfaces
usage_month_rolled_at - not relevant to network interfaces
virtual_machine_id - the ID of a virtual server to which this network interface is attached
adapter_type - the network adapter type provided for the VS that can be one of the following values:
- Vlance
- E1000
- E1000E
- VMXNET
- VMXNET2
- VMXNET3
- FLEXIBLE
3.7.3 Create vCloud Network Interface

To create a network interface, use the following request:

POST /virtual_machines/:virtual_server_id/network_interfaces.xml
POST /virtual_machines/:virtual_server_id/network_interfaces.json

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```

**Where:**

- **connected** - indicate whether the network interface is connected to a VS
- **network_join_id** - choose a network join
- **adapter_type** - the network adapter type provided for the VS that can be one of the following values:
  - Vlance
  - E1000
  - E1000E
  - VMXNET
  - VMXNET2
  - VMXNET3
  - FLEXIBLE

3.7.4 Edit vCloud Network Interface

To edit a network interface, use the following request:

PUT /virtual_machines/:virtual_server_id/network_interfaces/:id.xml
PUT /virtual_machines/:virtual_server_id/network_interfaces/:id.json

**XML Request Example**

```bash
```
JS

ON Request Example

Example

```shell
curl -i -X PUT
http://onapp.test/virtual_machines/12/network_interfaces/2.json -H
'Accept: application/json' -H 'Content-type: application/json' -u
user:userpass -d
'{"network_interface":{"primary":"1","connected":"1","network_join_id":"9" }}'
```

Where:

- **primary** - indicate whether this interface is primary
- **connected** - indicate whether the network interface is connected to a VS
- **network_join_id** - choose a network join

### 3.7.5 Delete vCloud Network Interface

To delete a network interface, use the following request:

**DELETE /virtual_machines/:virtual_server_id/network_interfaces/:id.xml**

**DELETE /virtual_machines/:virtual_server_id/network_interfaces/:id.json**

**XML Request Example**

```shell
curl -i -X DELETE
http://onapp.test/virtual_machines/12/network_interfaces/2.xml -u
user:userpass
```

**JSON Request Example**

```shell
curl -i -X DELETE
http://onapp.test/virtual_machines/12/network_interfaces/2.json -u
user:userpass
```

### 3.8 Cross VDC Networks API

This section provides the API calls you can use to manage cross VDC networks.

#### 3.8.1 Create Cross VDC Network

To create a cross VDC network, use the following request:

**POST /cross_vdc_networks.xml**

**POST /cross_vdc_networks.json**

**XML Request Example**

```shell
```

```shell
```

**JSON Request Example**

```shell
```
To edit a cross VDC network, use the following request:

PUT /cross_vdc_networks/:id.xml

XML Request Example

```bash
```

Where:

cross_vdc_network - an array of the parameters for the cross VDC network

label - a label of the cross VDC network

dc_group_id - a group ID of the cross VDC network

gateway_cidr - a network Classless Inter-Domain Routing (CIDR) setting in the format

`network_gateway_IP_address/subnet_prefix_length`

3.8.3 Delete Cross VDC Network

To delete a cross VDC network, use the following request:

DELETE /cross_vdc_networks/:id.xml
DELETE /cross_vdc_networks/:id.json

Where:

cross_vdc_network - an array of the parameters for the cross VDC network

label - a label of the cross VDC network
3.9 Orchestration Models API

This section provides the API calls you can use to manage the orchestration models imported from your vCloud.

3.9.1 Get List of Orchestration Models

To get the list of orchestration models, use the following request:

GET /vcloud/templates.xml
GET /vcloud/templates.json

**XML Request Example**

```bash
curl -i -X GET http://onapp.test/vcloud/templates.xml -u user:userpass
```

**JSON Request Example**

```bash
curl -i -X GET http://onapp.test/vcloud/templates.json -u user:userpass
```

**XML Output Example**

```xml
<templates>
  <template id="1" name="OrchModel1"/>
  <template id="2" name="OrchModel2"/>
</templates>
```
<vcloud_templates type="array">
  <vcloud_template>
    <cpu_allocation_customizable type="boolean">true</cpu_allocation_customizable>
    <cpu_allocation_default type="integer">12</cpu_allocation_default>
    <cpu_allocation_max type="integer">12</cpu_allocation_max>
    <cpu_allocation_min type="integer">1</cpu_allocation_min>
    <cpu_allocation_visible type="boolean">true</cpu_allocation_visible>
    <cpu_guaranteed_customizable type="boolean">true</cpu_guaranteed_customizable>
    <cpu_guaranteed_default type="integer">10</cpu_guaranteed_default>
    <cpu_guaranteed_max type="integer">100</cpu_guaranteed_max>
    <cpu_guaranteed_min type="integer">1</cpu_guaranteed_min>
    <cpu_guaranteed_visible type="boolean">true</cpu_guaranteed_visible>
    <cpu_quota_customizable type="boolean">false</cpu_quota_customizable>
    <cpu_quota_default nil="true"/></cpu_quota_default>
    <cpu_quota_max nil="true"/></cpu_quota_max>
    <cpu_quota_min nil="true"/></cpu_quota_min>
    <cpu_quota_visible type="boolean">false</cpu_quota_visible>
    <create_networks type="boolean">true</create_networks>
    <created_at type="datetime">2016-04-20T14:45:06+03:00</created_at>
    <data_stores_to_create type="array">
      <active_support_hash_with_indifferent_access>
        <label>* for VCD 8</label>
        <id>83a2f05b-47f1-4f21-a9de-43cfa2a82bd</id>
        <min type="integer">0</min>
        <max type="integer">999999</max>
        <default type="integer">100</default>
      </active_support_hash_with_indifferent_access>
      <data_store_visible type="boolean">true</data_store_visible>
      <data_store_customizable type="boolean">true</data_store_customizable>
      <use_it type="boolean">true</use_it>
    </active_support_hash_with_indifferent_access>
    <default_network_pool>131cfid-97dd-4531-96cf-ce2dc2ac426f</default_network_pool>

<vm_number_min type="integer">1</vm_number_min>
<vm_number_visible type="boolean">true</vm_number_visible>
</vcloud_template>
</vcloud_templates>

Where:

- **cpu_allocation_customizable** - whether the CPU allocation related parameters are editable during orchestration model deployment
- **cpu_allocation_default** - the default amount of allocated CPU resources, that will be set during orchestration model deployment
- **cpu_allocation_max** - the maximum amount of allocated CPU resources, that can be set during orchestration model deployment
- **cpu_allocation_min** - the minimum amount of allocated CPU resources, that can be set during orchestration model deployment
- **cpu_allocation_visible** - whether the CPU allocation related parameters will be visible during orchestration model deployment
- **cpu_guaranteed_customizable** - whether the CPU guaranteed related parameters will be editable during orchestration model deployment
- **cpu_guaranteed_default** - the default amount of guaranteed CPU, that will be set during orchestration model deployment
- **cpu_guaranteed_max** - the maximum amount of guaranteed CPU, that can be set during orchestration model deployment
- **cpu_guaranteed_min** - the minimum amount of guaranteed CPU, that can be set during orchestration model deployment
- **cpu_guaranteed_visible** - whether the CPU guaranteed related parameters will be visible during orchestration model deployment
- **cpu_quota_customizable** - whether the CPU quota related parameters will be editable during orchestration model deployment
- **cpu_quota_default** - the default CPU quota, that will be set during orchestration model deployment
- **cpu_quota_max** - the maximum CPU quota, that can be set during orchestration model deployment
cpu_quota_min - the minimum CPU quota, that can be set during orchestration model deployment

cpu_quota_visible - whether the CPU quota related parameters will be visible during orchestration model deployment

create_to_networks - the array of parameters related to the networks that will be created when the orchestration model is deployed

  name - the label for the network
  type - the type of the network: routed, isolated or direct
  network_address - the network address
  dns - DNS for the network

created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

data_stores_to_create - the array of parameters related to the data stores that will be created when the orchestration model is deployed

  label - the label of the data store zone in which a data store will be created during orchestration model deployment
  id - the ID of the data store zone in which a data store will be created during orchestration model deployment
  min - the minimum data store size that can be requested during orchestration model deployment
  max - the maximum data store size that can be requested during orchestration model deployment
  default - the default data store size that will be set during orchestration model deployment
  data_store_visible - whether the data store related parameters will be visible during orchestration model deployment
  data_store_customizable - whether the data store related parameters will be editable during orchestration model deployment
  use_it - whether the data store will be created during orchestration model deployment

data_store_visible - the array of parameters related to the data stores that will be created when the orchestration model is deployed

  label - the label of the data store zone in which a data store will be created during orchestration model deployment
  id - the ID of the data store zone in which a data store will be created during orchestration model deployment
  min - the minimum data store size that can be requested during orchestration model deployment
  max - the maximum data store size that can be requested during orchestration model deployment
  default - the default data store size that will be set during orchestration model deployment
  data_store_visible - whether the data store related parameters will be visible during orchestration model deployment
  data_store_customizable - whether the data store related parameters will be editable during orchestration model deployment
  use_it - whether the data store will be created during orchestration model deployment

default_network_pool - the network pool

deploy_edge_gateway - whether an edge gateway will be deployed during orchestration model deployment

deploy_edge_gateway - the label for the new edge gateway. The default name is MyEdgeGateway.

edge_gateway_name - the label for the new edge gateway. The default name is MyEdgeGateway.

edge_gateway_network_id - the ID of the edge gateway network

enable_fast_provisioning - whether fast provisioning is enabled

enable_thin_provisioning - whether thin provisioning is enabled

hypervisor_id - the ID of the compute resource associated with the orchestration model

id - the ID of the orchestration model

label - the name of the orchestration model

memory_customizable - whether memory related parameters are editable during orchestration model deployment

memory_default - the default amount of allocated memory, that will be set during orchestration model deployment

memory_guaranteed_customizable - whether memory guaranteed related parameters are editable during orchestration model deployment
memory_guaranteed_default - the default amount of guaranteed memory allocation, that will be set during orchestration model deployment

memory_guaranteed_max - the maximum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_min - the minimum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_visible - whether memory guaranteed related parameters are visible during orchestration model deployment

memory_max - the maximum amount of allocated memory, that can be set during orchestration model deployment

memory_min - the minimum amount of allocated memory, that can be set during orchestration model deployment

memory_quota_customizable - whether memory quota related parameters are editable during orchestration model deployment

memory_quota_default - the default amount of memory which can be used, that will be set during orchestration model deployment

memory_quota_max - the maximum amount of memory which can be used, that can be set during orchestration model deployment

memory_quota_min - the minimum amount of memory which can be used, that can be set during orchestration model deployment

memory_quota_visible - whether memory quota related parameters are visible during orchestration model deployment

memory_visible - whether memory related parameters are visible during orchestration model deployment

provider_vdc_id - the ID of the provider vDC that will be used when an organization vDC will be deployed from the orchestration model

updated_at - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format

vcpu_speed_customizable - whether vCPU speed related parameters are editable during orchestration model deployment

vcpu_speed_default - the default vCPU speed in MHz, that will be set during orchestration model deployment

vcpu_speed_max - the maximum vCPU speed in MHz, that can be set during orchestration model deployment

vcpu_speed_min - the minimum vCPU speed in MHz, that can be set during orchestration model deployment

vcpu_speed_visible - whether vCPU speed related parameters are visible during orchestration model deployment

vdc_model_type - the resource pool type

vm_number_customizable - whether VS number related parameters are editable during orchestration model deployment

vm_number_default - the default number of VSs, that will be set during orchestration model deployment

vm_number_max - the maximum number of VSs, that can be set during orchestration model deployment

vm_number_min - the minimum number of VSs, that can be set during orchestration model deployment

vm_number_visible - whether VS number related parameters are visible during orchestration model deployment
Page History
v. 5.1
- removed edge_gateway_uplink_network_id parameter

3.9.2 Get Orchestration Model Details
To get the details of a particular orchestration model, use the following request:
GET /vcloud/templates/:template_id.xml
GET /vcloud/templates/:template_id.json

XML Request Example

```
curl -i -X GET http://onapp.test/vcloud/templates/12.xml -u user:userpass
```

JSON Request Example

```
curl -i -X GET http://onapp.test/vcloud/templates/12.json -u user:userpass
```

XML Output Example
<vcloud_template>
<cpu_allocation_customizable type="boolean">true</cpu_allocation_customizable>
<cpu_allocation_default type="integer">1</cpu_allocation_default>

</vcloud_template>

Where:

- **cpu_allocation_customizable** - whether the CPU allocation related parameters are editable during orchestration model deployment
- **cpu_allocation_default** - the default amount of allocated CPU resources, that will be set during orchestration model deployment
- **cpu_allocation_max** - the maximum amount of allocated CPU resources, that can be set during orchestration model deployment
- **cpu_allocation_min** - the minimum amount of allocated CPU resources, that can be set during orchestration model deployment
- **cpu_allocation_visible** - whether the CPU allocation related parameters will be visible during orchestration model deployment

- **cpu_guaranteed_customizable** - whether the CPU guaranteed related parameters will be editable during orchestration model deployment
- **cpu_guaranteed_default** - the default amount of guaranteed CPU, that will be set during orchestration model deployment
- **cpu_guaranteed_max** - the maximum amount of guaranteed CPU, that can be set during orchestration model deployment
- **cpu_guaranteed_min** - the minimum amount of guaranteed CPU, that can be set during orchestration model deployment
- **cpu_guaranteed_visible** - whether the CPU guaranteed related parameters will be visible during orchestration model deployment

- **cpu_quota_customizable** - whether the CPU quota related parameters will be editable during orchestration model deployment
- **cpu_quota_default** - the default CPU quota, that will be set during orchestration model deployment
- **cpu_quota_max** - the maximum CPU quota, that can be set during orchestration model deployment
- **cpu_quota_min** - the minimum CPU quota, that can be set during orchestration model deployment
cpu_quota_visible - whether the CPU quota related parameters will be visible during orchestration model deployment

create_to_networks - the array of parameters related to the networks that will be created when the orchestration model is deployed

  name - the label for the network
  type - the type of the network: routed, isolated or direct
  network_address - the network address
  dns - DNS for the network

created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

data_stores_to_create - the array of parameters related to the data stores that will be created when the orchestration model is deployed

  label - the label of the data store zone in which a data store will be created during orchestration model deployment
  id - the ID of the data store zone in which a data store will be created during orchestration model deployment
  min - the minimum data store size that can be requested during orchestration model deployment
  max - the maximum data store size that can be requested during orchestration model deployment
  default - the default data store size that will be set during orchestration model deployment
  data_store_visible - whether the data store related parameters will be visible during orchestration model deployment
  data_store_customizable - whether the data store related parameters will be editable during orchestration model deployment
  use_it - whether the data store will be created during orchestration model deployment

data_store_visible - whether the data store related parameters will be visible during orchestration model deployment

data_store_customizable - whether the data store related parameters will be editable during orchestration model deployment

use_it - whether the data store will be created during orchestration model deployment

default_network_pool - the network pool

deploy_edge_gateway - whether an edge gateway will be deployed during orchestration model deployment

deploy_edge_gateway - whether an edge gateway will be deployed during orchestration model deployment

edge_gateway_name - the label for the new edge gateway. The default name is MyEdgeGateway.

data_gateway_network_id - the ID of the edge gateway network

enable_fast_provisioning - whether fast provisioning is enabled

enable_thin_provisioning - whether thin provisioning is enabled

hypervisor_id - the ID of the compute resource associated with the orchestration model

id - the ID of the orchestration model

data - the name of the orchestration model

memory_customizable - whether memory related parameters are editable during orchestration model deployment

memory_default - the default amount of allocated memory, that will be set during orchestration model deployment

memory_guaranteed_customizable - whether memory guaranteed related parameters are editable during orchestration model deployment

memory_guaranteed_default - the default amount of guaranteed memory allocation, that will be set during orchestration model deployment
memory_guaranteed_max - the maximum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_min - the minimum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_visible - whether memory guaranteed related parameters are visible during orchestration model deployment

memory_max - the maximum amount of allocated memory, that can be set during orchestration model deployment

memory_min - the minimum amount of allocated memory, that can be set during orchestration model deployment

memory_quota_customizable - whether memory quota related parameters are editable during orchestration model deployment

memory_quota_default - the default amount of memory which can be used, that will be set during orchestration model deployment

memory_quota_max - the maximum amount of memory which can be used, that can be set during orchestration model deployment

memory_quota_min - the minimum amount of memory which can be used, that can be set during orchestration model deployment

memory_quota_visible - whether memory quota related parameters are visible during orchestration model deployment

memory_visible - whether memory related parameters are visible during orchestration model deployment

provider_vdc_id - the ID of the provider vDC that will be used when an organization vDC will be deployed from the orchestration model

updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

vcpu_speed_customizable - whether vCPU speed related parameters are editable during orchestration model deployment

vcpu_speed_default - the default vCPU speed in MHz, that will be set during orchestration model deployment

vcpu_speed_max - the maximum vCPU speed in MHz, that can be set during orchestration model deployment

vcpu_speed_min - the minimum vCPU speed in MHz, that can be set during orchestration model deployment

vcpu_speed_visible - whether vCPU speed related parameters are visible during orchestration model deployment

vdc_model_type - the resource pool type

vm_number_customizable - whether VS number related parameters are editable during orchestration model deployment

vm_number_default - the default number of VSs, that will be set during orchestration model deployment

vm_number_max - the maximum number of VSs, that can be set during orchestration model deployment

vm_number_min - the minimum number of VSs, that can be set during orchestration model deployment

vm_number_visible - whether VS number related parameters are visible during orchestration model deployment
3.9.3 Create Orchestration Model

To create an orchestration model, use the following request:

POST /vcloud/templates.json

Example

Example

XML Request Example

Where:

* **label** - the name of the orchestration model
* **hypervisor_id** - the ID of the compute resource associated with the orchestration model
* **provider_vdc_id** - the ID of the provider vDC that will be used when an organization vDC will be deployed from the orchestration model
* **vdc_model_type** - the resource pool type: allocation, reservation or pay_as_you_go
* **cpu_allocation_min** - the minimum amount of allocated CPU resources, that can be set during orchestration model deployment
* **cpu_allocation_max** - the maximum amount of allocated CPU resources, that can be set during orchestration model deployment
* **cpu_allocation_default** - the default amount of allocated CPU resources, that will be set during orchestration model deployment
* **cpu_allocation_customizable** - set to "1", if you want the CPU allocation related parameters to be editable during orchestration model deployment, otherwise set to "0"
* **cpu_allocation_visible** - set to "1", if you want the CPU allocation related parameters to be visible during orchestration model deployment, otherwise set to "0"
* **cpu_guaranteed_min** - the minimum amount of guaranteed CPU, that can be set during orchestration model deployment
* **cpu_guaranteed_max** - the maximum amount of guaranteed CPU, that can be set during orchestration model deployment
* **cpu_guaranteed_default** - the default amount of guaranteed CPU, that will be set during orchestration model deployment
* **cpu_guaranteed_customizable** - set to "1", if you want the CPU guaranteed related parameters to be editable during orchestration model deployment, otherwise set to "0"
cpu_guaranteed_visible - set to "1", if you want the CPU guaranteed related parameters to be visible during orchestration model deployment, otherwise set to "0"

memory_min - the minimum amount of allocated memory, that can be set during orchestration model deployment

memory_max - the maximum amount of allocated memory, that can be set during orchestration model deployment

memory_default - the default amount of allocated memory, that will be set during orchestration model deployment

memory_customizable - set to "1", if you want the memory related parameters to be editable during orchestration model deployment, otherwise set to "0"

memory_visible - set to "1", if you want the memory related parameters to be visible during orchestration model deployment, otherwise set to "0"

memory_guaranteed_min - the minimum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_max - the maximum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_default - the default amount of guaranteed memory allocation, that will be set during orchestration model deployment

memory_guaranteed_customizable - set to "1", if you want the memory guaranteed related parameters to be editable during orchestration model deployment, otherwise set to "0"

memory_guaranteed_visible - set to "1", if you want the memory guaranteed related parameters to be visible during orchestration model deployment, otherwise set to "0"

vm_number_min - the minimum number of VSs, that will be set during orchestration model deployment

vm_number_max - the maximum number of VSs, that will be set during orchestration model deployment

vm_number_default - the default number of VSs, that will be set during orchestration model deployment

vm_number_customizable - set to "1", if you want the VS number related parameters to be editable during orchestration model deployment, otherwise set to "0"

vm_number_visible - set to "1", if you want the VS number related parameters to be visible during orchestration model deployment, otherwise set to "0"

default_network_pool - set a network pool

default_network_pool

edge_gateway_name - fill in the label for the new edge gateway. The default name is MyEdgeGateway.

networks_to_create - the array of parameters related to the networks that will be created when the orchestration model is deployed

  name - the label for the network

  type - the type of the network: routed, isolated or direct

  network_address - fill in the network address

  dns - DNS for the network

enable_thin_provisioning - set to "1" to enable thin provisioning, otherwise set to "0"

enable_fast_provisioning - set to "1" to enable fast provisioning, otherwise set to "0"

data_stores_to_create - the array of parameters related to the data stores that will be created when the orchestration model is deployed

  label - the label of the data store zone in which a data store will be created during orchestration model deployment
id - the ID of the data store zone in which a data store will be created during orchestration model deployment

min - the minimum data store size that can be requested during orchestration model deployment

max - the maximum data store size that can be requested during orchestration model deployment

default - the default data store size that will be set during orchestration model deployment

data_store_customizable - set to "true" if you want that the data store size can be altered during orchestration model deployment, otherwise set to "false"

data_store_visible - set to "true" for the data store to be listed during orchestration model deployment, otherwise set to "false". If the data store zone is not visible, a data store will still be created in it.

use_it - set to "true" for the data store to be created during orchestration model deployment, otherwise set to "false"

### Page History

v. 5.1

- removed edge_gateway_uplink_network_id parameter

### 3.9.4 Edit Orchestration Model

To edit an orchestration model, use the following request:

PATCH /vcloud/templates/:id.xml
PATCH /vcloud/templates/:id.json

**XML Request Example**

```

```

```
JSON Request Example

curl -i -X PATCH http://onapp.test/vcloud/templates/12.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"vcloud_template":{"label":"My Orchestration Model","hypervisor_id":"11","provider_vdc_id":"23","vdc_model_type":"allocation","cpu_allocation_min":"1","cpu_allocation_max":"12","cpu_allocation_default":"1","cpu_allocation_visible":"true","memory_min":"40","memory_default":"8","memory_customizable":"true","memory_visible":"true","memory_guaranteed_min":"20","memory_guaranteed_max":"100","vm_number_min":"1","vm_number_max":"500","vm_number_default":"100","vm_number_customizable":"true","vm_number_visible":true,"default_network_pool":"131cfd1d-44dd-4531-96cf-ce2dc2a426f","edge_gateway_name":"MyEdgeGateway","networks_to_create":[{"name":"Network-1","type":"routed","network_address":"11.11.1.1/24","dns":"9.9.9.9"},"name":"Network-2","type":"routed","network_address":"11.11.2.1/24","dns":"9.9.4.4"],"enable_thin_provisioning":true,"enable_fast_provisioning":true,"data_stores_to_create":[{"label":"BronzeStorageforvCloud8","id":"44a2105b-74df-4f21-a9de-43cfa28282d","min":0,"max":999999,"default":1000,"data_store_customizable":true,"data_store_visible":true,"use_it":true},"label":"BronzeStorageforvCloud8","id":"b5e6e041-114a-45e0-909d-ee18971a9be9","min":0,"max":999999,"default":1000,"data_store_customizable":true,"data_store_visible":true,"use_it":true},"label":"GoldStorageforvCloud8","id":"55abf6c6-6dbc-429d-9be0-61d6d38c3e0","min":0,"max":999999,"default":1000,"data_store_customizable":true,"data_store_visible":true,"use_it":true}'}

Where:

- **label** - the name of the orchestration model
- **hypervisor_id** - the ID of the compute resource associated with the orchestration model
- **provider_vdc_id** - the ID of the provider vDC that will be used when an organization vDC will be deployed from the orchestration model
- **vdc_model_type** - the resource pool type: allocation, reservation or pay_as_you_go
- **cpu_allocation_min** - the minimum amount of allocated CPU resources, that can be set during orchestration model deployment
cpu_allocation_max - the maximum amount of allocated CPU resources, that can be set during orchestration model deployment

cpu_allocation_default - the default amount of allocated CPU resources, that will be set during orchestration model deployment

cpu_allocation_customizable - set to "1", if you want the CPU allocation related parameters to be editable during orchestration model deployment, otherwise set to "0"

cpu_allocation_visible - set to "1", if you want the CPU allocation related parameters to be visible during orchestration model deployment, otherwise set to "0"

cpu_guaranteed_min - the minimum amount of guaranteed CPU, that can be set during orchestration model deployment

cpu_guaranteed_max - the maximum amount of guaranteed CPU, that can be set during orchestration model deployment

cpu_guaranteed_default - the default amount of guaranteed CPU, that will be set during orchestration model deployment

cpu_guaranteed_customizable - set to "1", if you want the CPU guaranteed related parameters to be editable during orchestration model deployment, otherwise set to "0"

cpu_guaranteed_visible - set to "1", if you want the CPU guaranteed related parameters to be visible during orchestration model deployment, otherwise set to "0"

memory_min - the minimum amount of allocated memory, that can be set during orchestration model deployment

memory_max - the maximum amount of allocated memory, that can be set during orchestration model deployment

memory_default - the default amount of allocated memory, that will be set during orchestration model deployment

memory_customizable - set to "1", if you want the memory related parameters to be editable during orchestration model deployment, otherwise set to "0"

memory_visible - set to "1", if you want the memory related parameters to be visible during orchestration model deployment, otherwise set to "0"

memory_guaranteed_min - the minimum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_max - the maximum amount of guaranteed memory allocation, that can be set during orchestration model deployment

memory_guaranteed_default - the default amount of guaranteed memory allocation, that will be set during orchestration model deployment

memory_guaranteed_customizable - set to "1", if you want the memory guaranteed related parameters to be editable during orchestration model deployment, otherwise set to "0"

memory_guaranteed_visible - set to "1", if you want the memory guaranteed related parameters to be visible during orchestration model deployment, otherwise set to "0"

vm_number_min - the minimum number of VSs, that will be set during orchestration model deployment

vm_number_max - the maximum number of VSs, that will be set during orchestration model deployment

vm_number_default - the default number of VSs, that will be set during orchestration model deployment

vm_number_customizable - set to "1", if you want the VS number related parameters to be editable during orchestration model deployment, otherwise set to "0"

vm_number_visible - set to "1", if you want the VS number related parameters to be visible during orchestration model deployment, otherwise set to "0"
default_network_pool - set a network pool

default_network_pool - set a network pool

edge_gateway_name - fill in the label for the new edge gateway. The default name is MyEdgeGateway.

networks_to_create - the array of parameters related to the networks that will be created when the orchestration model is deployed

  name - the label for the network

  type - the type of the network: routed, isolated or direct

  network_address - fill in the network address

  dns - DNS for the network

enable_thin_provisioning - set to "1" to enable thin provisioning, otherwise set to "0"

enable_fast_provisioning - set to "1" to enable fast provisioning, otherwise set to "0"

data_stores_to_create - the array of parameters related to the data stores that will be created when the orchestration model is deployed

  label - the label of the data store zone in which a data store will be created during orchestration model deployment

  id - the ID of the data store zone in which a data store will be created during orchestration model deployment

  min - the minimum data store size that can be requested during orchestration model deployment

  max - the maximum data store size that can be requested during orchestration model deployment

  default - the default data store size that will be set during orchestration model deployment

  data_store_customizable - set to "true" if you want that the data store size can be altered during orchestration model deployment, otherwise set to "false"

  data_store_visible - set to "true" for the data store to be listed during orchestration model deployment, otherwise set to "false". If the data store zone is not visible, a data store will still be created in it.

  use_it - set to "true" for the data store to be created during orchestration model deployment, otherwise set to "false"

3.9.5 Deploy Orchestration Model

To deploy an orchestration model, use the following request:

POST /vcloud/templates/:template_id/deploy.xml

POST /vcloud/templates/:template_id/deploy.json

XML Request example:
curl -i -X POST http://onapp.test/vcloud/templates/:template_id/deploy.xml
   -H 'Accept: application/xml'
   -H 'Content-type: application/xml'
   -u user:userpass
   -d
   '&vcloud_template'""user_group_id""174""vdc_label""MyResourcePool1""cpu_allocation""10""cpu_guaranteed""10""cpu_speed""20""memory""8""memory_guaranteed""20""storage_profile""47a2105b-47f1-4f21-a9de-43cfd2a82bd""networks_to_create""*""default_gateway_name""EdgeGatewayName""default_gateway_ip_net_id""1532""use_default_route_for_dns_relay""1""networks_created""""Name1", "Name2"

JSON Request example:

```
curl -i -X POST http://onapp.test/vcloud/templates/:template_id/deploy.json
   -H 'Accept: application/json'
   -H 'Content-type: application/json'
   -u user:userpass
   -d
   '{"vcloud_template":
   "user_group_id": "174",
   "vdc_label": "My ResourcePool1",
   "cpu_allocation": "1",
   "cpu_guaranteed": "10",
   "cpu_speed": "20",
   "memory": "8",
   "memory_guaranteed": "20",
   "storage_profile": "55a2105b-47f1-4f21-a9de-43cfd2a82bd",
   "networks_to_create": ["*"],
   "default_gateway_name": "EdgeGatewayName",
   "default_gateway_ip_net_id": "1532",
   "use_default_route_for_dns_relay": "1",
   "networks_created": ["Name1", "Name2"]}
```

Where:

- **user_group_id** - the ID of the organization with which the orchestration model will be associated
- **vdc_label** - the label for a resource pool that will be created after the template is deployed
- **cpu_allocation** - amount of CPU resources (GHZ) that will be allocated after the template is deployed
- **cpu_guaranteed** - amount of guaranteed CPU allocation (%)
- **cpu_speed** - the vCPU speed in MHz that can be consumed after the template is deployed
- **cpu_quota** - the CPU quota
- **memory** - the amount of memory (MB) that will be allocated after the template is deployed
- **memory_guaranteed** - amount of guaranteed memory allocation (%)
memory_quota - the memory quota
vm_number - the number of VSs that can be created after the template is deployed
storage_profile - the default storage policy
name - the name of the default network
data_stores_created - the list of the networks created
name - the name of the network

Page History:
v.6.1 Edge 2
• Added the default_gateway_ip_net_id and use_default_route_for_dns_relay parameters
v.5.8
• added edge_gateway_name, networks_created and name parameters
v. 5.1:
• added edge_gateway_uplink_networks parameter
• added edge_gateway_uplink_network parameter

3.9.6 Clone Orchestration Model
To clone an orchestration model, use the following request:
PUT /vcloud/templates/:id/clone.xml
PUT /vcloud/templates/:id/clone.json

XML Request Example

JSON Request Example
Where you indicate in the URL the ID of the cloned orchestration model.

### 3.9.7 Delete Orchestration Model

To delete an orchestration model, use the following request:

```
DELETE /vcloud/templates/:template_id.xml
DELETE /vcloud/templates/:template_id.json
```

**XML Request Example**

```
curl -i -X DELETE http://onapp.test/vcloud/templates/12.xml -u user:userpass
```

**JSON Request Example**

```
curl -i -X DELETE http://onapp.test/vcloud/templates/12.json -u user:userpass
```

### 3.10 Organizations API

This section contains the API requests you can use to manage VMware Cloud Director organizations in OnApp.

#### 3.10.1 Get List of Organizations

To view the list of organizations, use the following request:

```
GET /organizations.xml
GET /organizations.json
```

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**
<vcloud_organizations type="array">
  <vcloud_organization>
    <id type="integer">19</id>
    <user_group_id type="integer">705</user_group_id>
    <hypervisor_id type="integer">19</hypervisor_id>
    <label>MyNewOrg</label>
    <identifier>09822e9c-e43a-4a20-8892-6f465e79a9a0</identifier>
    <created_at type="dateTime">2017-10-03T17:16:23+03:00</created_at>
    <updated_at type="dateTime">2017-10-03T17:16:23+03:00</updated_at>
  </vcloud_organization>
</vcloud_organizations>

Where:

id - the ID of the organization
user_group_id - ID of the user group with which the organization is associated
hypervisor_id - the ID of the VCD compute resource with which the new organization is to be associated
label - the name of the organization
identifier - the identifier of the organization
created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

3.10.2 Get Organization Details

To view the details of an organization, use the following request:

GET /organizations/:id.xml
GET /organizations/:id.json

XML Request Example

JSON Request Example

XML Output Example
<vcloud_organization>
    <id type="integer">19</id>
    <user_group_id type="integer">705</user_group_id>
    <hypervisor_id type="integer">19</hypervisor_id>
    <label>MyNewOrg</label>
    <identifier>09822e9c-e43a-4a20-8892-6f465e79a9a0</identifier>
    <created_at type="dateTime">2017-10-03T17:16:23+03:00</created_at>
    <updated_at type="dateTime">2017-10-03T17:16:23+03:00</updated_at>
</vcloud_organization>

Where:

id - the ID of the organization

user_group_id - ID of the user group with which the organization is associated.

hypervisor_id - the ID of the VCD compute resource with which the new organization is to be associated

label - the name of the organization

identifier - the identifier of the organization

created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

3.10.3 Create Organization

To create a new organization, use the following request:

POST /organizations.xml

POST /organizations.json

XML Request Example

curl -i -X POST http://onapp.test/organizations.xml -d '<?xml version="1.0" encoding="UTF-8"?>
<vcloud_organization><label>TEST_XML</label><user_group_id>1</user_group_id><hypervisor_id>1</hypervisor_id><create_user_group>false</create_user_group><user_bucket_id>1</user_bucket_id></vcloud_organization>'

JSON Request Example

curl -i -X POST http://onapp.test/organizations.json -d '{"vcloud_organization":{"label":"TEST_JSON","user_group_id":1,"hypervisor_id":1,"create_user_group":0,"user_bucket_id":1}}' -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml'

Where:

label* - the name of the organization. Can contain only alphanumeric characters or one of the following characters: [ -_ . ]

user_group_id - the user group with which this organization is to be associated. This parameter applies only if you disable the create_user_group parameter.
It is required to indicate either the `user_group_id` or the `create_user_group` parameter.

`hypervisor_id` - the VCD compute resource with which the new organization is to be associated.
`create_user_group` - whether you wish to create a new user group with which this organization will be associated. If you enable this option, a new user group with the label of this organization will be created and will contain this organization. If you do not enable this option, you can associate this organization with an already existing user group. To enable set to ‘1’, otherwise, set to ‘0’.

`user_bucket_id` - the bucket for the user group that is to be created once to create this organization. If not set, the first available company billing plan is selected. This parameter applies only if you disable the `create_user_group` parameter.

### 3.10.4 Delete Organization

To delete an organization, use the following request:

**DELETE** `/organizations/:id.xml`

**DELETE** `/organizations/:id.json`

**XML Request Example**

```
```

**JSON Request Example**

```
```

### 3.11 Organization Networks API

This section provides the API calls you can use to manage Organization networks imported from vCloud.

#### 3.11.1 Get List of vCloud Organization Networks

To view the list of organization networks, use the following request:

**GET** `/org_networks.xml`

**GET** `/org_networks.json`

**XML Request Example**

```
```

**JSON Request Example**
XML Output Example

```xml
<org_networks type="array">
  <org_network>
    <vdc_id>6</vdc_id>
    <dns_suffix>null</dns_suffix>
    <updated_at>2016-02-01T11:47:41+00:00</updated_at>
    <is_nated>true</is_nated>
    <secondary_dns>null</secondary_dns>
    <id>25</id>
    <user_id>null</user_id>
    <vapp_id>null</vapp_id>
    <dvportgroup>null</dvportgroup>
    <label>statis.network</label>
    <gateway>10.0.10.1</gateway>
    <shared>false</shared>
  </org_network>

  <default_outside_ip_address_id>null</default_outside_ip_address_id>
  <prefix_size>null</prefix_size>
  <ip_address_pool_id>null</ip_address_pool_id>
  <netmask>255.255.255.0</netmask>
  <vlan>null</vlan>
  <default_nat_rule_number>9999</default_nat_rule_number>
  <fence_mode>natRouted</fence_mode>
  <created_at>2016-02-01T11:47:41+00:00</created_at>
  <enabled>true</enabled>
  <primary_dns>null</primary_dns>
  <identifier>04114f87-bfb4-4f66-ac0a-2651c1ca54d1</identifier>
  <network_group_id>16</network_group_id>
</org_networks>
```

Where:

- `created_at` - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format
- `default_nat_rule_number` - default NAT rule
- `default_outside_ip_address_id` - ID of the outside IP address
- `dns_suffix` - the DNS suffix
- `dvportgroup` - the portgroup that backs this network
- `enabled` - whether the network is enabled or not
- `fence_mode` - isolation type of the network
- `gateway` - the gateway associated with the network
- `id` - the ID of the network
- `identifier` - the identifier of the network
- `ip_address_pool_id` - ID of the IP Address Pool
- `is_nated` - set true to use NAT for translating the traffic. Set false if you are using your own firewall with external IP address
- `label` - the name of the network
- `netmask` - IP of the network mask
network_group_id - network zone ID
prefix_size - subnet prefix size
primary_dns - IP address of the primary domain name system (DNS) server
secondary_dns - IP address of the secondary domain name system (DNS) server
shared - whether this organization network is shared or not
updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
user_id - owner ID
vapp_id - the vApp associated with the network
vdc_id - the resource pool associated with the network
vlan - VLAN number

3.11.2 Get vCloud Organization Network Details
To view the details of the organization network, use the following request:

GET /org_networks/:id.xml
GET /org_networks/:id.json

XML Request Example

curl -i -X GET -u user:userpass --url
'Content-type: application/xml'

JSON Request Example

curl -i -X GET -u user:userpass --url
'Content-type: application/json'

XML Output Example
<org_network>
  <vdc_id>6</vdc_id>
  <dns_suffix>null</dns_suffix>
  <updated_at>2016-02-01T11:47:41+00:00</updated_at>
  <is_nated>true</is_nated>
  <secondary_dns>null</secondary_dns>
  <id>25</id>
  <user_id>null</user_id>
  <vapp_id>null</vapp_id>
  <dvportgroup>null</dvportgroup>
  <label>statis.network</label>
  <gateway>10.0.10.1</gateway>
  <shared>false</shared>
  <default_outside_ip_address_id>null</default_outside_ip_address_id>
    <prefix_size>null</prefix_size>
    <ip_address_pool_id>null</ip_address_pool_id>
  <netmask>255.255.255.0</netmask>
  <vlan>null</vlan>
  <default_nat_rule_number>9999</default_nat_rule_number>
  <fence_mode>natRouted</fence_mode>
  <created_at>2016-02-01T11:47:41+00:00</created_at>
  <enabled>true</enabled>
  <primary_dns>null</primary_dns>
  <identifier>0411f487-bfb4-4f66-ac0a-2651c1ca54d1</identifier>
  <network_group_id>16</network_group_id>
</org_network>

Where:

created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

default_nat_rule_number - default NAT rule

default_outside_ip_address_id - ID of the outside IP address
dns_suffix - the DNS suffix
dvportgroup - the portgroup that backs this network
enabled - whether the network is enabled or not
fence_mode - isolation type of the network
gateway - the gateway associated with the network
id - the ID of the network
identifier - the identifier of the network
ip_address_pool_id - ID of the IP Address Pool
is_nated - set true to use NAT for translating the traffic. Set false if you are using your own
  firewall with external IP address
label - the name of the network
netmask - IP of the network mask
network_group_id - network zone ID
prefix_size - subnet prefix size
primary_dns - IP address of the primary domain name system (DNS) server
secondary_dns - IP address of the secondary domain name system (DNS) server
shared - whether this organization network is shared or not
updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
user_id - owner ID
vapp_id - the vApp associated with the network
vdc_id - the resource pool associated with the network
vlan - VLAN number

3.11.3 Create vCloud Organization Network

To create an organization network, use the following request:

POST /org_networks.xml
POST /org_networks.json

You can create the following types of organization networks:

- Direct organization network
- Routed organization network
- Isolated organization network

3.11.3.1 Create Direct Network

XML Request Example

```
```

JSON Request Example

```
```

HTTP 201 response is returned on the successful creation of a direct NSX-T network with the shared parameter set to 0. HTTP 422 response is returned upon failure to create a direct NSX-T network with the shared parameter set to 1.

Where:

- **label** - the name of the network
- **vdc_id** - ID of the resource pool to which the network will be connected
- **fence_mode** - the type of the organization network, in this case, it is 'bridged'
- **parent_network_id** - the ID of the external network with which the direct organization network will be associated
- **shared** - set 1 to make the direct organization network shared, otherwise set 0

3.11.3.2 Create Routed Network

XML Request Example
curl -i -X POST -u user:userpass --url http://onapp.test/org_networks.xml
-H 'Accept: application/xml' -H 'Content-type: application/xml' -d
  '<org_network><label>test</label><vdc_id>13</vdc_id><fence_mode>natRouted</fence_mode><parent_network_id>991</parent_network_id><network_gateway_cidr>11.0.0.2/22</network_gateway_cidr><shared>0</shared><primary_dns>191.170.0.2</primary_dns><secondary_dns>191.170.0.3</secondary_dns><dns_suffix>24</dns_suffix><ip_ranges_attributes type="array"><ip_ranges_attribute><start_address>11.0.0.2</start_address><end_address>11.0.0.6</end_address></ip_ranges_attribute></ip_ranges_attributes><edge_gateway>4</edge_gateway></org_network>'

JSON Request Example

curl -i -X POST -u user:userpass --url http://onapp.test/org_networks.json
-H 'Accept: application/json' -H 'Content-type: application/json' -d
  '{"org_network": {"label": "test", "vdc_id": "13", "fence_mode": "natRouted", "parent_network_id": "991", "network_gateway_cidr": "11.0.0.2/22", "shared": "0", "use_gateway_dns": "0", "primary_dns": "191.170.0.2", "secondary_dns": "191.170.0.3", "dns_suffix": "24", "ip_ranges_attributes": [{"start_address": "11.0.0.2", "end_address": "11.0.0.6"}], "edge_gateway": "4"}}'

HTTP 201 response is returned on the successful creation of a routed NSX-T network with the shared parameter set to 0. HTTP 422 response is returned upon failure to create a routed NSX-T network with the shared parameter set to 1.

**Where:**

*label* - the name of the network  
*vdc_id* - ID of the resource pool to which the network will be connected  
*fence_mode* - the type of the organization network, in this case, it is 'natRouted'  
*parent_network_id* - the ID of the external network with which the routed organization network will be associated  
*network_gateway_cidr* - specify a network address (CIDR address format with gateway address)  
*shared* - set 1 to make the routed organization network shared, otherwise set 0  
*primary_dns* - the IP address of the primary domain name system (DNS) server  
*secondary_dns* - the IP address of the secondary domain name system (DNS) server  
*dns_suffix* - the DNS suffix  
*ip_ranges_attributes* - an array of static IP pools (applicable to isolated and routed org networks)  

*ip_ranges_attribute* - a static IP pool (applicable to isolated and routed org networks)  
  *start_address* - specify the start IP address  
  *end_address* - specify the end IP address  
*edge_gateway* - the edge gateway to which the network will be connected
3.11.3.3 Create Isolated Network

**XML Request Example**

```bash
curl -i -X POST -u user:userpass --url http://onapp.test/org_networks.xml
-H 'Accept: application/xml' -H 'Content-type: application/xml' -d
"<org_network><label>test</label><vdc_id>13</vdc_id><fence_mode>isolated</fence_mode><parent_network_id>993</parent_network_id><network_gateway_cidr>10.0.0.1/22</network_gateway_cidr><shared>0</shared><primary_dns>10.0.0.2</primary_dns><secondary_dns>10.0.0.3</secondary_dns><dns_suffix>24</dns_suffix><ip_ranges_attributes><ip_ranges_attribute><start_address>10.0.0.4</start_address><end_address>10.0.0.8</end_address></ip_ranges_attribute></ip_ranges_attributes><edge_gateway>5</edge_gateway><organization><organization_id>1640</organization_id></organization></org_network>"
```

**JSON Request Example**

```bash
curl -i -X POST -u user:userpass --url http://onapp.test/org_networks.json
-H 'Accept: application/json' -H 'Content-type: application/json' -d
'{"org_network": {"label": "test", "vdc_id": "13", "fence_mode": "isolated", "parent_network_id": "993", "network_gateway_cidr": "10.0.0.1/22", "shared": "0", "primary_dns": "10.0.0.2", "secondary_dns": "10.0.0.3", "dns_suffix": "24", "ip_ranges_attributes": [{"start_address": "10.0.0.4","end_address": "10.0.0.8"}],"edge_gateway": "5", "organization": [{"organization_id": "1640"}]}}'
```

HTTP 201 response is returned on the successful creation of an isolated NSX-T network with the `shared` parameter set to 0. HTTP 422 response is returned upon failure to create an isolated NSX-T network with the `shared` parameter set to 1.

**Where:**
- `label` - the name of the network
- `vdc_id` - ID of the resource pool to which the network will be connected
- `fence_mode` - the type of the organization network, in this case, it is 'isolated'
- `parent_network_id` - the ID of the external network with which the isolated organization network will be associated
- `network_gateway_cidr` - specify a network address (CIDR address format with gateway address)
- `shared` - set 1 to make the isolated organization network shared, otherwise set 0
- `primary_dns` - the IP address of the primary domain name system (DNS) server
- `secondary_dns` - the IP address of the secondary domain name system (DNS) server
- `dns_suffix` - the DNS suffix
- `ip_ranges_attributes` - an array of static IP pools (applicable to isolated and routed org networks)
  - `ip_ranges_attribute` - a static IP pool (applicable to isolated and routed org networks)
    - `start_address` - specify the start IP address
    - `end_address` - specify the end IP address
- `edge_gateway` - the edge gateway to which the network will be connected
- `organization_id` - the ID of the organization
3.11.4 Edit vCloud Organization Network

To edit an organization network, use the following request:

PUT /org_networks/:id.xml
PUT /org_networks/:id.json

You can edit the following types of organization networks:

- **Direct organization network**
- **Routed organization network**
- **Isolated organization network**

**Edit Direct Network XML Request Example**

```
curl -i -X PUT -u user:userpass --url
http://onapp.test/org_networks/12.xml
-H 'Accept: application/xml' -H
'Content-type: application/xml' -d
'"org_network": {"label": "direct", "shared": 0, "primary_dns": 
"", "secondary_dns": 
"", "dns_suffix": 
""}
```

**Edit Direct Network JSON Request Example**

```
curl -i -X PUT -u user:userpass --url
http://onapp.test/org_networks/12.json
-H 'Accept: application/json' -H
'Content-type: application/json' -d 
'{"org_network": "label": "direct", 
"shared": "0", "primary_dns": 
"", "secondary_dns": 
"", "dns_suffix": 
""}]
```

Where:

- **label** - the name of the network
- **shared** - set 1 to make the direct organization network shared, otherwise set 0
- **primary_dns** - the IP address of the primary domain name system (DNS) server
- **secondary_dns** - the IP address of the secondary domain name system (DNS) server
- **dns_suffix** - the DNS suffix

An HTTP 201 response is returned upon successfully editing a direct NSX-T network with the `shared` parameter set to 0.

An HTTP 422 response is returned upon failure to edit a direct NSX-T network by setting the `shared` parameter to 1.

**Edit Routed Network XML Request Example**
Edit Routed Network JSON Request Example

curl -i -X PUT -u user:userpass --url
http://onapp.test/org_networks/12.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"org_network": {"label": "routed", "shared": "0", "primary_dns": ":", "secondary_dns": ":", "dns_suffix": ":", "ip_ranges_attributes": [{"start_address": ":", "end_address": ":"]}}'}

Where:

- **label** - the name of the network
- **shared** - set 1 to make the routed organization network shared, otherwise set 0
- **primary_dns** - the IP address of the primary domain name system (DNS) server
- **secondary_dns** - the IP address of the secondary domain name system (DNS) server
- **dns_suffix** - the DNS suffix
- **ip_ranges_attributes** - an array of static IP pools (applicable to isolated and routed org networks)
- **ip_ranges_attribute** - a static IP pool (applicable to isolated and routed org networks)
  - **start_address** - specify the start IP address
  - **end_address** - specify the end IP address

An HTTP 201 response is returned upon successfully editing a routed NSX-T network with the **shared** parameter set to 0.

An HTTP 422 response is returned upon failure to edit a routed NSX-T network by setting the **shared** parameter to 1.

Edit Isolated Network XML Request Example

curl -i -X PUT -u user:userpass --url
http://onapp.test/org_networks/12.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -d '<org_network><label>isolated</label><shared>0</shared><primary_dns></primary_dns><secondary_dns></secondary_dns><dns_suffix></dns_suffix><ip_ranges_attributes><ip_ranges_attribute><start_address></start_address><end_address></end_address></ip_ranges_attribute></ip_ranges_attributes><ip_ranges_attributes><start_address></start_address><end_address></end_address></ip_ranges_attributes></org_network>'

Edit Isolated Network JSON Request Example
curl -i -X PUT -u user:userpass --url http://onapp.test/org_networks/12.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"org_network": {"label": "isolated", "shared": "0", "primary_dns": "", "secondary_dns": "", "dns_suffix": "", "ip_ranges_attributes": [{"start_address": ", "end_address": "]}}}'}

**Where:**

*label* - the name of the network

*shared* - set 1 to make the isolated organization network shared, otherwise set 0

*primary_dns* - the IP address of the primary domain name system (DNS) server

*secondary_dns* - the IP address of the secondary domain name system (DNS) server

*dns_suffix* - the DNS suffix

*ip_ranges_attributes* - an array of static IP pools (applicable to isolated and routed org networks)

*ip_ranges_attribute* - a static IP pool (applicable to isolated and routed org networks)

  *end_address* - specify the end IP address

  *start_address* - specify the start IP address

An HTTP 201 response is returned upon successfully editing an isolated NSX-T network with the *shared* parameter set to 0.

An HTTP 422 response is returned upon failure to edit an isolated NSX-T network by setting the *shared* parameter to 1.

### 3.11.5 Delete vCloud Organization Network

To delete an organization network, use the following request:

DELETE /org_networks/:id.xml

DELETE /org_networks/:id.xml

**XML Request Example**

**JSON Request Example**

### 3.12 Resource Pools API

This section provides the API calls you can use to manage resource pools imported from VMware Cloud Director.
3.12.1 Get List of Resource Pools

To view the list of resource pools, use the following request:

GET /vdcs.xml
GET /vdcs.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```
<vdc>
  <identifier>85ed3313-4d02-4128-86af-d1686de265f1</identifier>
  <label>ote_static_vcd_e_res_pool</label>
  <fast_provisioning type="boolean">false</fast_provisioning>
  <allocation_model>AllocationVApp</allocation_model>
  <enabled type="boolean">true</enabled>
  <vcpu_speed type="integer">1000</vcpu_speed>
  <thin_provisioning type="boolean">false</thin_provisioning>
  <network_quota type="integer">100</network_quota>
  <updated_at type="dateTime">2021-04-06T09:52:27+03:00</updated_at>
  <organization_id type="integer">2</organization_id>
  <provider_vdc_id type="integer">1</provider_vdc_id>
  <created_at type="dateTime">2021-04-06T07:39+03:00</created_at>
  <id type="integer">2</id>
  <cpu_allocated type="float">0.0</cpu_allocated>
  <cpu_limit type="float">0.0</cpu_limit>
  <cpu_used type="float">6.0</cpu_used>
  <cpu_reserved type="float">0.0</cpu_reserved>
  <guaranteed_cpu type="float">20.0</guaranteed_cpu>
  <memory_allocated type="float">0.0</memory_allocated>
  <memory_limit type="float">0.0</memory_limit>
  <memory_used type="float">11.0</memory_used>
  <memory_reserved type="float">0.0</memory_reserved>
  <guaranteed_memory type="float">20.0</guaranteed_memory>
  <locked type="boolean">false</locked>
  <network_provider_type>NSX_T</network_provider_type>
  <vm_quota type="integer">0</vm_quota>
</vdc>
```

Where:

- **identifier** - the identifier of the resource pool
- **label** - the name of the resource pool
- **fast_provisioning** - true if the fast provisioning is enabled for this resource pool; otherwise false
- **allocation_model** - the type resource pool
- **enabled** - true if the resource pool is enabled; otherwise false
- **vcpu_speed** - the speed of vCPU (in MHz)
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>thin_provisioning</td>
<td>- true if the thin provisioning is enabled for this resource pool; otherwise false</td>
</tr>
<tr>
<td>network_quota</td>
<td>- the number of networks that can be created within this resource pool</td>
</tr>
<tr>
<td>updated_at</td>
<td>- the date in the [YYYY][MM][DD][hh][mm][ss]Z format</td>
</tr>
<tr>
<td>organization_id</td>
<td>- the ID of the organization, to which the resource pool is assigned</td>
</tr>
<tr>

<td>- the amount of memory (%) guaranteed to this resource pool</td>
</tr>
<tr>
<td>locked</td>
<td>- true, if the resource pool is locked; otherwise, false</td>
</tr>
<tr>
<td>network_provider_type</td>
<td>- the type of the network provider, can be NSX_T, NSX_V, or NONE</td>
</tr>
<tr>
<td>vm_quota</td>
<td>- the number of virtual servers that can be created within this resource pool</td>
</tr>
</tbody>
</table>

**Page History**

v. 6.6 Edge 4
Added network_provider_type parameter.

v. 5.6
Added the provider_vdc_id parameter.

### 3.12.2 Get Resource Pool Details

To view the details of a resource pool, use the following request:

GET /vdcs/:id.xml
GET /vdcs/:id.json

**XML Request Example**

```
curl -i -X GET -u user:userpass --url http://onapp.test/vdcs/6.xml -H
'Accept: application/xml' -H 'Content-type: application/xml'
```

**JSON Request Example**

```
curl -i -X GET -u user:userpass --url http://onapp.test/vdcs/6.json -H
'Accept: application/json' -H 'Content-type: application/json'
```
XML Output Example

```xml
<vdc>
  <allocation_model>AllocationPool</allocation_model>
  <guaranteed_memory>0.2</guaranteed_memory>
  <cpu_allocated>6000</cpu_allocated>
  <updated_at>2016-02-02T23:00:35+00:00</updated_at>
  <cpu_limit>6000</cpu_limit>
  <cpu_used>2000</cpu_used>
  <guaranteed_cpu>0.11</guaranteed_cpu>
  <id>6</id>
  <vcpu_speed>1000</vcpu_speed>
  <label>onapp vDC 1 allocation pool</label>
  <thin_provisioning>true</thin_provisioning>
  <memory_used>1536</memory_used>
  <memory_limit>8192</memory_limit>
  <vm_quota>0</vm_quota>
  <memory_reserved>1638</memory_reserved>
  <fast_provisioning>true</fast_provisioning>
  <network_quota>1000</network_quota>
  <provider_vdc_id>51</provider_vdc_id>
  <created_at>2016-02-01T11:43:43+00:00</created_at>
  <enabled>true</enabled>
  <cpu_reserved>660</cpu_reserved>
  <memory_allocated>8192</memory_allocated>
  <user_group_id>11</user_group_id>
  <identifier>9d740561-7960-4fdc-b795-c33142a6d125</identifier>
</vdc>
```

Where:

- `allocation_model` - the type resource pool
- `guaranteed_memory` - the amount of memory (%) guaranteed to this resource pool
- `cpu_allocated` - the amount of CPU (MHz) allocated to this resource pool
- `updated_at` - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- `cpu_limit` - the maximum amount of CPU resources which can be used
- `cpu_used` - the amount of used CPU resources
- `guaranteed_cpu` - the amount of CPU resources (%) guaranteed to this resource pool
- `id` - the ID of the resource pool
- `vcpu_speed` - the speed of vCPU (in MHz)
- `label` - the name of the resource pool
- `thin_provisioning` - true if the thin provisioning is enabled for this resource pool; otherwise false
- `memory_used` - the amount of used memory (MB)
- `memory_limit` - the maximum amount of memory which can be used
- `vm_quota` - the number of virtual servers that can be created within this resource pool
- `memory_reserved` - the amount of reserved memory (MB)
- `fast_provisioning` - true if the fast provisioning is enabled for this resource pool; otherwise false
- `network_quota` - the number of networks that can be created within this resource pool
- `provider_vdc_id` - the provider resource pool ID
- `created_at` - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- `enabled` - true if the resource pool is enabled; otherwise false
**cpu_reserved** - the amount of reserved CPU resources

**memory_allocated** - the amount of memory (MB) allocated to this resource pool

**user_group_id** - the ID of the organization, to which the resource pool is assigned

**identifier** - the identifier of the resource pool

**Page History**

v. 5.6

- added the **provider_vdc_id** parameter

### 3.12.3 Get Billing Statistics for Resource Pool

Use the following API call to view the billing statistics for a resource pool:

GET `/vdcs/:id/statistics.xml`

GET `/vdcs/:id/statistics.json`

**XML Request Example**

```bash
curl -i -X GET http://onapp.test/vdcs/88779/statistics.xml -u user:userpass
```

**JSON Request Example**

```bash
curl -i -X GET http://onapp.test/vdcs/88779/statistics.json -u user:userpass
```

External network labels in vCloud and vCenter should be identical and unique, otherwise, network interface statistics will incorrect.

**XML Output Example**
<vdc_stat type="array">
  <vdc_stat>
    <id type="integer">88779</id>
    <company_id type="integer">89</company_id>
    <vdc_id type="integer">48</vdc_id>
    <cost type="float">0.0</cost>
    <currency_code>USD</currency_code>
    <stat_time type="datetime">2016-01-01T00:00:00Z</stat_time>
    <created_at type="datetime">2016-01-01T00:00:31Z</created_at>
    <updated_at type="datetime">2016-01-01T00:00:31Z</updated_at>
    <vdc_model_type>Allocation</vdc_model_type>
    <status type="symbol">enabled</status>
    <resource_elements>
      <cpu_allocation type="float">1.0</cpu_allocation>
      <cpu_resource_guaranteed type="float">10.0</cpu_resource_guaranteed>
      <cpu_used type="float">0.0</cpu_used>
      <deployed_edge_gateways type="float">1.0</deployed_edge_gateways>
      <deployed_org_networks type="float">0.0</deployed_org_networks>
      <fast_provisioning_set type="float">1.0</fast_provisioning_set>
      <memory_allocation type="float">8.0</memory_allocation>
      <memory_resource_guaranteed type="float">10.0</memory_resource_guaranteed>
      <memory_used type="float">0.0</memory_used>
      <thin_provisioning_set type="float">0.0</thin_provisioning_set>
      <vcpu_speed type="decimal">1000.0</vcpu_speed>
      <vs_count type="float">0.0</vs_count>
      <vs_limit type="float">100.0</vs_limit>
    </resource_elements>
    <data_stores type="array">
      <data_store>
        <data_store_id type="integer">64</data_store_id>
        <allocated_amount type="float">512.0</allocated_amount>
        <used_amount type="float">300.0</used_amount>
      </data_store>
    </data_stores>
    <network_interfaces type="array">
      <network_interface>
        <network_interface_id type="integer">117</network_interface_id>
        <data_sent type="float">0.0</data_sent>
        <data_received type="float">0.0</data_received>
      </network_interface>
    </network_interfaces>
  </vdc_stat>
</vdc_stat>

Where:

- **id** - the ID of this unit of statistics
- **company_id** - ID of the company with which the resource pool is associated
- **vdc_id** - ID of the resource pool to which these statistics refer
- **cost** - the total due for the resource pool, network usage and storage policy usage for the hour for which these statistics have been generated
- **currency_code** - the code of the currency you’re going to charge in
- **stat_time** - the time when the statistics have been recorded
- **created_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
vdc_model - the type of resource pool (allocation, reservation or Pay-As-You-Go)

status - whether the resource pool is enabled or not

resource_elements - an array of parameters that refer to resource pools:
  cost - the total due for the resource
  compute zone - ID of the compute zone
  cpu_limit (for Pay-As-You-Go resource pool only) - the maximum amount of CPU resources which can be used
  cpu_allocation - the amount of CPU (GHz) allocated to this resource pool
  cpu_resource_guaranteed - the amount of CPU resources (%) guaranteed to this resource pool
  cpu_used - the amount of CPU resources used during the hour for which these statistics has been generated
  deployed_edge_gateways - the total number of edge gateways deployed within this resource pool
  deployed_org_networks - the total number of org networks deployed within this resource pool
  fast_provisioning_set - 1.0 if fast provisioning is enabled for the resource pool, otherwise 0.0
  memory_limit (for Pay-As-You-Go resource pool only) - the maximum amount of memory which can be used
  memory_allocation - the amount of memory (GB) allocated to this resource pool
  memory_resource_guaranteed - the amount of memory (%) guaranteed to this resource pool
  memory_used - the amount of memory (GB) used during the hour for which these statistics have been generated
  thin_provisioning_set - 1.0 if thin provisioning is enabled for the resource pool, otherwise 0.0
  vcpu_speed - the vCPU speed that can be consumed after the resource pool is created
  vs_count - the number of VSs deployed within the resource pool
  vs_limit - the number of virtual servers that can be created within this resource pool (VS quota)

data_stores - an array of parameters that refer to data stores:
  data_store_zone_id - the ID of the data store zone associated with the resource pool
  data_store_id - the ID of the data store associated with the resource pool
  cost - the total due for the resource
  allocated_amount - the amount of disk size allocated to this resource pool. For Pay-as-you-go, if the allocated amount is unlimited, OnApp represents it as 99999 value.
  used_amount - the amount of disk size (GB) used during the hour for which these statistics have been generated

network_interfaces - an array of parameters that refer to network interfaces:
  network_zone_id - ID of the network zone associated with the resource pool
  network_interface_id - ID of the network interface associated with the resource pool
  cost - the total due for the resource
  data_sent - the amount of data sent during the hour for which these statistics have been generated
  data_received - the amount of data received during the hour for which these statistics have been generated
*ip_addresses* - the total number of IP addresses used at the point when these statistics were generated

**Page History**

v5.0

- added the following parameters:
  - *cost*
  - *compute zone*
  - *deployed_org_networks*
  - *data_store_zone_id*
  - *network_zone_id*
  - *cpu_limit*
  - *memory_limit*

### 3.12.4 Get List of Provider Resource Pools

Ensure that *Provider resource pools* permissions are on. For more information about permissions refer to the [Permissions](#) section of this guide.

To view the list of provider vDCs, use the following request:

**GET /provider_vdcs.xml**

**GET /provider_vdcs.json**

**XML Request Example**

```
curl -i -X GET http://onapp.test/provider_vdcs.xml -u user:userpass
```

**JSON Request Example**

```
curl -i -X GET http://onapp.test/provider_vdcs.json -u user:userpass
```

**XML Output Example**
<provider_vdcs type="array">
  <provider_vdc>
    <id type="integer">13</id>
    <label>pvDC 1 Cluster1</label>
    <cpu_allocated type="integer">0</cpu_allocated>
    <cpu_total type="integer">35880</cpu_total>
    <cpu_used type="integer">81160</cpu_used>
    <created_at type="datetime">2016-04-19T12:57:27+03:00</created_at>
    <enabled type="boolean">true</enabled>
    <hypervisor_id type="integer">24</hypervisor_id>
    <identifier>4b5330c2-449c-4b30-b156-fb4901c1235b</identifier>
    <memory_allocated type="integer">0</memory_allocated>
    <memory_total type="integer">50683</memory_total>
    <memory_used type="integer">18716</memory_used>
    <network_provider_type type="integer">1</network_provider_type>
    <updated_at type="datetime">2016-05-06T01:00:34+03:00</updated_at>
    <external_networks type="array">
      <external_network>
        <backing_type>DV_PORTGROUP</backing_type>
        <created_at type="datetime">2016-04-19T12:58:12+03:00</created_at>
        <default_nat_rule_number type="integer">9999</default_nat_rule_number>
        <default_max_iops type="integer">15000</default_max_iops>
        <default_burst_iops type="integer">15000</default_burst_iops>
      </external_network>
    </external_networks>
  </provider_vdc>
</provider_vdcs>
<min_disk_size type="integer">1</min_disk_size>
</storage_policy>
<storage_policy>...</storage_policy>
</storage_policies>
<network_pools type="array">
<network_pool>
<closed type="boolean">false</closed>
<created_at type="datetime">2016-04-19T12:57:27+03:00</created_at>

<provider_vdc_id type="integer">13</provider_vdc_id>
<traded type="boolean">false</traded>
<updated_at type="datetime">2016-04-19T12:57:27+03:00</updated_at>
</network_pool>
<network_pool>...</network_pool>
</network_pools>
</provider_vdc>
</provider_vdcs>

Where:

- **id** - the ID of the provider resource pool
- **label** - the name of the provider resource pool
- **cpu_allocated** - the amount of CPU (MHz) allocated to this provider resource pool
- **cpu_total** - the total amount of CPU on the provider resource pool
- **cpu_used** - the number of used CPU resources
- **created_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **enabled** - true if the provider resource pool is enabled; otherwise false
- **hypervisor_id** - the ID of the compute resource
- **identifier** - the identifier of the provider resource pool
- **memory_allocated** - the amount of memory (MB) allocated to this provider resource pool
- **memory_total** - the total amount of memory on the provider resource pool
- **memory_used** - the amount of used memory (MB)
- **network_provider_type** - the type of the network provider, where 1 stands for NSX-V, 2 stands for NSX-T, and 0 for none
- **updated_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **external_networks** - the array of parameters related to the external network(s) associated with the provider resource pool
- **backing_type** - NSX_TIER0 for NSX-T and DVPORRT_GOUP for NSX-V
- **created_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **default_nat_rule_number** - default NAT rule
- **default_outside_ip_address_id** - ID of the outside IP address
dns_suffix - the DNS suffix

dvportgroup - the port group that backs this network

enabled - whether the network is enabled or not

fence_mode - isolation type of the network

gateway - the gateway associated with the network

id - the ID of the network

identifier - the identifier of the network

ip_address_pool_id - ID of the IP Address Pool

is_nated - true if the NAT is used for translating the traffic; false if you are using your own firewall with the external IP address

label - the name of the network

netmask - IP of the network mask

network_group_id - network zone ID

parent_network_id - not relevant to external networks

prefix_size - subnet prefix size

primary_dns - IP address of the primary domain name system (DNS) server

secondary_dns - IP address of the secondary domain name system (DNS) server

shared - whether this external network is shared or not

updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

user_id - owner ID

vapp_id - the vApp associated with the network

vdc_id - the resource pool associated with the network

vlan - VLAN number

storage_policies - the array of parameters related to the storage policies associated with the vDC

closed - not relevant to storage policies

created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

draas_id - not relevant to storage policies

federation_enabled - not relevant to storage policies

federation_id - not relevant to storage policies

hypervisor_id - the ID of the compute resource

id - the ID of the storage policy

identifier - the identifier of the storage policy

label - the name of the storage policy

location_group_id - ID of a location group the storage policy is assigned to

preconfigured_only - whether the storage policy can be used for creating Instance Package VSSs only. When this option is enabled, the storage policy cannot be used during custom virtual server (VSSs built by setting resources manually) creation.

provider_vdc_id - the provider resource pool ID

traded - not relevant to storage policies

updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
default_max_iops - the default maximum IOPS value for the data store zone

default_burst_iops - the default peak IOPS value

min_disk_size - minimum disk size for the data store zone

network_pools - the array of parameters related to the network pool(s) associated with the vDC

closed - not relevant to network pools

created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

draas_id - not relevant to network pools

federation_enabled - not relevant to network pools

federation_id - not relevant to network pools

hypervisor_id - the ID of the compute resource

id - the ID of the network pool

identifier - the identifier of the network pool

label - the name of the network pool

location_group_id - ID of a location group the network pool is assigned to

preconfigured_only - whether the network pool can be used for creating Instance Package VSSs only. When this option is enabled, the pool cannot be used during custom virtual server (VSSs built by setting resources manually) creation.

provider_vdc_id - the provider resource pool ID

traded - not relevant to storage policies

Page history:

v. 6.6 Edge 4

Added network_provider_type and backing_type parameters.

3.12.5 Create Resource Pool

To create a resource pool, use the following request:

POST /vdcs.xml

POST /vdcs.json

XML Request Example

JSON Request Example
"label": "foobar2", "network_pool_identifier": "222and215-97dd-4531-96cf-ce2d2ac426f", "user_group_id": "8", "provider_vdc_id": "1", "allocation_model": "AllocationPool", "cpu_allocated": "1.1", "memory_allocated": "10", "guaranteed_cpu": "30", "guaranteed_memory": "20", "vm_quota": "100", "network_quota": "500", "thin_provisioning": "true", "fast_provisioning": "true", "data_stores_attributes": [{"data_store_group_id": "4", "data_store_size": "22", "data_store_type": "vcloud"}]}'}}

Where:

* label - specify a name for the resource pool
* user_group_id - specify the ID of a user group to which this resource pool will be assigned
* provider_vdc_id - indicate the provider resource pool ID
* network_pool_identifier - fill in the ID of the default network pool for the resource pool
* allocation_model - choose the type of resource pool (AllocationVApp, AllocationPool, ReservationPool). Depending on the type selected, the compute resource parameters will differ:

**AllocationVApp (Pay-As-You-Go):**

* guaranteed_cpu - specify the amount of guaranteed CPU allocation (%)
* guaranteed_memory - specify the amount of guaranteed memory allocation (%)
* vm_quota - specify the number of VSs that can be created after the resource pool is deployed
* network_quota - specify the number of org networks that can be created after the resource pool is deployed
* cpu_limit - specify the maximum amount of CPU (in GHz) that can be requested
* memory_limit - specify the maximum amount of memory (in GB) which can be used
* vcpu_speed - specify the vCPU speed that can be consumed after the resource pool is created (in MHz)

**AllocationPool:**

* cpu_allocated - specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created
* memory_allocated - specify the amount of memory (in GB) allocated to this resource pool
* guaranteed_cpu - specify the amount of guaranteed CPU allocation (%)
* guaranteed_memory - specify the amount of guaranteed memory allocation (%)
* vm_quota - specify the number of VSs that can be created after the resource pool is deployed
* network_quota - specify the number of org networks that can be created after the resource pool is deployed

**ReservationPool:**

* cpu_allocated - specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created
* memory_allocated - specify the amount of memory (in GB) allocated to this resource pool
* vm_quota - specify the number of VSs that can be created after the resource pool is deployed
* network_quota - specify the number of org networks that can be created after the resource pool is deployed

**Data Stores Attributes:**
thin_provisioning - true if thin provisioning is enabled for this resource pool; otherwise false
fast_provisioning - true if fast provisioning is enabled for this resource pool; otherwise false
data_store_group_id - indicate the data store group ID
data_store_size - specify the size of the data store. For Pay-As-You-Go resource pools, you can set 0 to create a data store with unlimited capacity.
data_store_type - specify the type of the data store (vcloud)

Page History
v 6.0
• added the network_quota parameter.
v 5.0
• added the network_pool_identifier parameter.

3.12.6 Edit Resource Pool
To edit a resource pool, use the following request:
PUT /vdcs/:id.xml
PUT /vdcs/:id.json
XML Request example:

JSON Request example:
curl -i -X PUT -u user:userpass --url http://onapp.test/vdcs/:id.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"vdc": {"cpu_allocated": "2.2"}}'  

Where:
Depending on the resource pool type, the following parameters can be edited:

network_pool_identifier - fill in the ID of the default network pool for the resource pool
cpu_allocated - specify the amount of CPU resources (GHz) that will be allocated after the resource pool is created
memory_allocated - specify the amount of memory (in GB) allocated to this resource pool
guaranteed_cpu - specify the amount of guaranteed CPU allocation (%)
guaranteed_memory - specify the amount of guaranteed memory allocation (%)
vm_quota - specify the number of VSs that can be created after the resource pool is deployed
network_quota - specify the number of org networks that can be created after the resource pool is deployed
cpu_limit - specify the maximum amount of CPU (in GHz) that can be requested
memory_limit - specify the maximum amount of memory (in GB) which can be used
**vcpu_speed** - specify the vCPU speed that can be consumed after the resource pool is created (in MHz)

**thin_provisioning** - true if thin provisioning is enabled for this resource pool; otherwise false

**fast_provisioning** - true if fast provisioning is enabled for this resource pool; otherwise false

**Page History:**

v 6.0
Added the `network_quota` parameter.

v 5.1
Added the `network_pool_identifier` parameter.

### 3.12.7 Delete Resource Pool

You can delete a resource pool that contains no vApps, Org Networks, or catalogs with templates. To delete a resource pool, use the following request:

DELETE /vdcs/:id.xml
DELETE /vdcs/:id.json

**XML Request Example**

```bash
curl -i -X DELETE http://onapp.test/vdcs/:id.xml -u user:userpass
```

**JSON Request Example**

```bash
curl -i -X DELETE http://onapp.test/vdcs/:id.json -u user:userpass
```

### 3.12.8 Create Resource Pool Data Store

To create a resource pool data store, use the following request:

POST /vdcs/:id/data_stores.xml
POST /vdcs/:id/data_stores.json

**XML Request Example**

```bash
curl -i -X POST -u user:userpass --url
'Content-type: application/xml' -d
'<data_store><data_store_group_id>29</data_store_group_id><data_store_size
>100</data_store_size><data_store_type>vcloud</data_store_type><default>1</
data_store>'
```

**JSON Request Example**
curl -i -X POST -u user:userpass --url
http://onapp.test/vdcs/12/data_stores.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"data_store": {"data_store_group_id": "29", "data_store_size": "100", "data_store_type": "vcloud", "default": "1"}}';

Where:

data_store_group_id - indicate the data store group ID

data_store_size - specify the size of the data store. For Pay-As-You-Go resource pools, you can set 0 to create a data store with unlimited capacity.

data_store_type - specify the type of the data store (vcloud)

💡 default - set 1 to make the data store a default one, otherwise, set 0

Page History

v. 6.0

- added the default parameter

3.12.9 Edit Resource Pool Data Store

To edit a resource pool data store, use the following request:

PUT /vdcs/:resource_pool_id/data_stores/:data_store_id.xml
PUT /vdcs/:resource_pool_id/data_stores/:data_store_id.json

XML Request Example

curl -i -X PUT -u user:userpass --url

JSON Request Example

curl -i -X PUT -u user:userpass --url
http://onapp.test/vdcs/12/data_stores/1.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"data_store": {"enabled": "false", "data_store_size": "200", "default": "1"}}';

Where:

enabled - true if data store is enabled in vCloud, otherwise, false

data_store_size - specify the size of the data store. For Pay-As-You-Go resource pools, you can set 0 to create a data store with unlimited capacity.

💡 default - set 1 to make the data store a default one, otherwise, set 0

Page History
v. 6.0

- added the `default` parameter

### 3.12.10 Delete Resource Pool Data Store

To delete a resource pool data store, use the following request:

DELETE /vdcs/:resource_pool_id/data_stores/:data_store_id.xml

DELETE /vdcs/:resource_pool_id/data_stores/:data_store_id.json

**XML Request Example**

```
curl -i -X DELETE -u user:userpass --url http://onapp.test/vdcs/12/data_stores/1.xml
```

**JSON Request Example**

```
curl -i -X DELETE -u user:userpass --url http://onapp.test/vdcs/12/data_stores/1.json
```

### 3.13 User Groups API

VMware Cloud Director organizations are associated with user groups in OnApp. Several organizations can be associated with a single user group. In this case, the users within the user group will have access to the resources of all organizations in the user group. This section contains the API requests you can use to manage user groups in your cloud.

#### 3.13.1 Get List of User Groups

To get the list of user groups:

GET /user_groups.xml

GET /user_groups.json

**XML Request Example**

```
curl -i -u user:userpass -X GET http://onapp.test/user_groups.xml -H 'Accept: application/xml' -H 'Content-type: application/xml'
```

**JSON Request Example**

```
curl -i -u user:userpass -X GET http://onapp.test/user_groups.json -H 'Accept: application/json' -H 'Content-type: application/json'
```

**XML Output Example**
<user_groups type="array">
  <user_group>
    <closed type="boolean">false</closed>
    <created_at type="datetime">2015-04-15T16:02:20+03:00</created_at>
    <federation_enabled type="boolean">false</federation_enabled>
    <federation_id nil="true"></federation_id>
    <id type="integer">56</id>
    <identifier>abywlogotbqza</identifier>
    <label>test</label>
    <traded type="boolean">false</traded>
    <updated_at type="datetime">2015-04-15T16:02:20+03:00</updated_at>
    <user_buckets type="array">
      <user_bucket>
        <id type="integer">1</id>
        <label>default</label>
        <created_at type="dateTime">2017-11-24T12:09:57+00:00</created_at>
        <currency_code>USD</currency_code>
        <show_price nil="true"/>
        <monthly_price type="decimal">0.0</monthly_price>
        <allows_mak type="boolean">true</allows_mak>
        <allows_kms type="boolean">false</allows_kms>
        <allows_own type="boolean">false</allows_own>
      </user_bucket>
    </user_buckets>
    <roles type="array">
      <role>
        <id type="integer">1</id>
        <label>Administrator</label>
        <identifier>admin</identifier>
        <created_at type="datetime">2013-09-03T15:31:13+03:00</created_at>
        <updated_at type="datetime">2015-04-15T15:26:46+03:00</updated_at>
        <users_count type="integer">24</users_count>
      </role>
    </roles>
  </user_group>
</user_groups>

Where:

closed - not relevant to user groups

created_at – the date when this record was created in database

federation_enabled - not relevant to user groups

id – the group ID

identifier —identifier of the user group

label – the group name

traded - not relevant to user groups

updated_at – the date when this record was updated in database

user_buckets — an array of buckets to which this account is assigned to, where

id - the bucket type ID

label - the bucket name

created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
updated_at - the date when the bucket was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

currency_code - the currency in which the users are charged

show_price - true, if users can see the prices set up for them, otherwise false

monthly_price - monthly fee for plan usage

allows_kms - true, if the KMS licensing is allowed for this bucket, otherwise false

allows_mak - true, if the MAK licensing is allowed, otherwise false

allows_own - true, if adding own licenses is allowed for this bucket, otherwise false

roles — an array of user roles to which this account is assigned to, where

created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

id – role ID

label – role title

identifier – role identifier

created_at – the date in the [YYYY][MM][DD][hh][mm][ss]Z format

updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

users_count - the number of users assigned to the role

3.13.2 Get User Group Details

To get details for a particular user group:

GET /user_groups/:id.xml

GET /user_groups/:id.json

XML Request Example

curl -i -u user:userpass -X GET http://onapp.test/user_groups/56.xml -H 'Accept: application/xml' -H 'Content-type: application/xml'

JSON Request Example

curl -i -u user:userpass -X GET http://onapp.test/user_groups/56.json -H 'Accept: application/json' -H 'Content-type: application/json'

XML Output Example
Where:

closed - not relevant to user groups

created_at – the date when this record was created in database

federation_enabled - whether Federation is enabled for the compute zone

federation_id - not relevant to user groups

id – the group ID

identifier —identifier of the user group

label – the group name

traded - not relevant to user groups

updated_at – the date when this record was updated in database

buckets_id — an array of buckets to which this account is assigned to, where

    id - the bucket type ID

    label - the bucket name

    created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format

    updated_at - the date when the bucket was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

    currency_code - the currency in which the users are charged
show_price - true, if users can see the prices set up for them, otherwise false
monthly_price - monthly fee for plan usage
allows_kms - true, if the KMS licensing is allowed for this bucket, otherwise false
allows_mak - true, if the MAK licensing is allowed, otherwise false
allows_own - true, if adding own licenses is allowed for this bucket, otherwise false
roles — an array of user roles to which this account is assigned to, where
created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
id – role ID
label – role title
identifier – role identifier
created_at – the date in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
users_count - the number of users assigned to the role

3.13.3 Get List of Users Assigned to User Group
To get details for a particular user group:
GET /user_groups/:id/users.xml
GET /user_groups/:id/users.json

XML Request Example
```
curl -i -u user:userpass -X GET http://onapp.test/user_groups/12/users.xml
-H 'Accept: application/xml' -H 'Content-type: application/xml'
```

JSON Request Example
```
curl -i -u user:userpass -X GET
http://onapp.test/user_groups/12/users.json -H 'Accept: application/json'
-H 'Content-type: application/json'
```

XML Output Example
<customer_network_id nil="true"/>
<disallowed_primary type="boolean">false</disallowed_primary>
<gateway>109.123.105.145</gateway>
<hypervisor_id nil="true"/>
<id type="integer">652</id>
<ip_address_pool_id nil="true"/>
<network_address>109.123.105.144</network_address>
<network_id type="integer">36</network_id>
<pxe type="boolean">false</pxe>
<updated_at type="datetime">2012-07-26T02:32:13-10:00</updated_at>
<user_id nil="true"/>
<free type="boolean">false</free>
<netmask>255.255.255.240</netmask>
</ip_address>
</used_ip_addresses>
<memory_available type="integer">3091</memory_available>
<disk_space_available type="integer">222</disk_space_available>
<cdn_reference type="integer">945453445</cdn_reference>
<additional_fields type="array">
<additional_field>
<name>add_field1</name>
</additional_field>
</additional_fields>
</user>
</users>

Where:

**activated_at** – time when the user was activated

**avatar** - user's avatar

**bucket_id** – ID of the bucket assigned to this user

**cdn_account_status** – always returns ACTIVE status; but it is actually activated when CDN was enabled for particular user

**cdn_status** - whether CDN resources are enabled for this user or not

**created_at** – time when the user was created, in [YYYY][MM][DD]T[hh][mm][ss]Z

**deleted_at** – time when the user was deleted

**email** – user's email

**firewall_id** - the ID of the firewall the user is associated with

**first_name** – user's first name

**group_id** - deprecated attribute; will be removed in upcoming release

**id** — the ID of a user in the database

**image_template_group** – the ID of associated template group, if any

**infoboxes** - an array of infoboxes with the following details:

  - **hidden_infoboxes** - an array of hidden infoboxes
  - **hidden_infobox** - hash of a hidden infobox
  - **display_infoboxes** - true, if the infoboxes are displayed for this user, otherwise false

**last_name** – the user’s last name

**locale** – locale (language) associated with user

**login** – user’s login name
Login parameter is not returned when API key is used for authentication instead of a
login/password combination.

*password_changed_at* - the date when the user's password was changed in the
YYYY-MM-DDTHH:MM:SSZ format

*registered_yubikey* - true, if the user has enabled logging in using a YubiKey, otherwise false.
To view the Yubikey(s) associated with a certain user, refer to Get List of User's YubiKeys. For
the API request that adds a YubiKey, refer to Add YubiKey to User.

*status* – status of the user's account (active, suspended or deleted)

*supplied* - whether the user was created for the supplier when he published a zone to the
Federation. If true, no actions can be performed on this user

*suspend_at* – time when the system should suspend a user

*time_zone* - the time zone of the user

*total_amount* - sum total of outstanding and payment amount

*updated_at* – time when user's profile data was updated

*use_gravatar* – true, if avatar is enabled for the user, otherwise false

*user_group_id* – ID of the user group assigned to this user

*outstanding_amount* – the amount of money the user is due to pay

*payment_amount* – amount of money the user has actually paid

*roles* — an array of user roles to which this account is assigned to, where

*created_at* - the date in the YYYY-MM-DDTHH:MM:SSZ format

*id* – role ID

*identifier* – role identifier

*label* – role title

*updated_at* - the date in the YYYY-MM-DDTHH:MM:SSZ format

*permissions* – an array with permissions assigned to this role

*created_at* - the date in the YYYY-MM-DDTHH:MM:SSZ format

*id* – permission ID

*identifier* – permission identifier

*label* – permission title

*updated_at* - the date in the YYYY-MM-DDTHH:MM:SSZ format

*used_cpus* – number of CPU cores allocated to all virtual servers and edge servers of the user

*used_memory* - the amount of RAM used by the user (MB)

*used_cpu_shares* - the amount of CPU shares used

*used_disk_size* – size of all user disks in GB

*used_ip_addresses* – an array of IP addresses associated with the user

*ip_address* - an array of IP address with the following parameters:

*address* - IP address

*broadcast* – broadcast address

*created_at* — the date in the YYYY-MM-DDTHH:MM:SSZ format
3.13.4 Get User Group Billing Reports
To get billing reports for a user group, use the following requests:
GET /user_groups/:id/report.xml
GET /user_groups/:id/report.json

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```

**XML Output Example**
<billing_user_group_reports type="array">
  <billing_user_group_report>
    <from type="dateTime">2018-06-01T00:00:00</from>
    <till type="dateTime">2018-06-08T23:59:59</till>
    <user_id type="integer">9501</user_id>
    <virtual_machine_id type="integer">19682</virtual_machine_id>
    <resource_pool_costs type="decimal">11275.0</resource_pool_costs>
    <network_costs type="decimal">0.0</network_costs>
    <storage_costs type="decimal">176.0</storage_costs>
    <service_addon_costs type="decimal">0.0</service_addon_costs>
    <total_cost type="decimal">11451.0</total_cost>
  </billing_user_group_report>
  <billing_user_group_report>...</billing_user_group_report>
</billing_user_group_reports>

Where:
from - the start date for generating statistics in the [YYYY][MM][DD][hh][mm][ss] format
till - the end date for generating statistics in the [YYYY][MM][DD][hh][mm][ss] format
user_id - the ID of the user who owns the virtual server
virtual_machine_id - the ID of the virtual server for which the report is generated
resource_pool_costs - the price for the usage of resource pool for the specified period of time
network_costs - the price for the usage of network resources for the specified period of time
storage_costs - the price for the usage of storage resources for the specified period of time
service_addon_costs - the price for the usage of service add-ons for the specified period of time
total_cost - the price for all used resources
(resource_pool_costs, network_costs, storage_costs, and service_addon_costs) for the specified period of time

3.13.5 Add User Group
To create a user group use this request:

POST /user_groups.xml
POST /user_groups.json

XML Request example

curl -i -X POST http://onapp.test/user_groups.xml -d '<?xml version="1.0" encoding="UTF-8"?><user_group><label>TEST_XML</label><bucket_id>1</bucket_id><user_bucket_ids type="array"><user_bucket_id>1</user_bucket_id></user_bucket_ids><assign_vcloud_roles>false</assign_vcloud_roles><role_ids type="array"></role_id></role_ids></user_group>' -u user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml'

JSON Request example
curl -i -X POST http://onapp.test/user_groups.json -d '{"user_group":{"label":"TEST_JSON","bucket_id":1,"user_bucket_ids":[1],"assign_vcloud_roles":0,"role_ids":[]}}' -u user:userpass -H 'Accept: application/json' -H 'Content-type: application/json'

Where:

* **label** - the name of the user group

* **user_bucket_id** - ID of a user bucket which will be assigned to this user group

* **bucket_ids** - IDs of buckets which will be available to users of this user group

* **assign_vcloud_roles** - set to 'true', for the default VMware Cloud Director roles to be automatically assigned to the user group, otherwise, set to 'false'

* **role_ids** - IDs of roles that will be assigned to the user group. This parameter is ignored when the **assign_vcloud_roles** parameter is set to 'true'.

**Page History**

v.6.0

- replaced the following parameters:
  - **user_bucket_id** - to **bucket_id**
  - **bucket_ids** - to **user_bucket_ids**

### 3.13.6 Edit User Group

This API call allows you to edit a user group. It can also be used to assign a role and/or a bucket to the user group.

PUT /user_groups/:id.xml
PUT /user_groups/:id.json

**XML Request Example**

```bash
curl -i -X PUT http://onapp.test/user_groups/4.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<user_group><label>new_label</label><role_ids type="array"><role_id>2</role_id></role_ids><bucket_ids type="array"><bucket_id>1</bucket_id></bucket_ids></user_group>'
```

**JSON Request Example**

```bash
curl -i -X PUT http://onapp.test/user_groups/4.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"user_group":{"label":"new_label","role_ids":[]}}'
```

Where:

* **label** - choose user group name

* **role_ids** - ID of the role(s) you wish to assign to the user group

* **bucket_ids** - ID of the bucket(s) you wish to assign to the user group
3.13.7 Delete User Group

To delete a user group:

DELETE /user_groups/:user_group_id.xml
DELETE /user_groups/:user_group_id.json

XML Request Example

```bash
curl -i -X DELETE http://onapp.test/user_groups/12.xml -u user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml'
```

JSON Request Example

```bash
curl -i -X DELETE http://onapp.test/user_groups/12.json -u user:userpass -H 'Accept: application/json' -H 'Content-type: application/json'
```

Returns 204 response on successful deletion, or 404 response if no user group with such ID exists in the DB

3.14 Users API

This chapter includes sections related to VMware Cloud Director users management. For more information on Users API, refer to the linked guide.

3.14.1 Edit VMware Cloud Director Credentials

To edit a user's VMware Cloud Director credentials, use the following request:

PUT /users/:user_id/vcloud_credentials.xml
PUT /users/:user_id/vcloud_credentials.json

XML Request Example

```bash
```

JSON Request Example

```bash
curl -i -X PUT -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/users/12/vcloud_credentials.json -d '{"vcloud_credentials":{"password": "newpassword"}}'
```

Where:

`password` - type in your VMware Cloud Director password

3.14.2 Add VCD User

Use the POST method to create a new vCloud user account:
POST /users.xml
POST /users.json

**XML Request Example**

```bash
curl -i -X POST -d "<user><login>111111losj</login><email>MailTestApi@testmatil.com</email><first_name>TestApiName</first_name><last_name>TestAPIName</last_name><password_test1</password><user_group_id>1</user_group_id><billing_plan_id>1</billing_plan_id><role_ids type="array"><role_id>1</role_id></role_ids><additional_fields type="array"><additional_field><name>additional_field_name</name><value>custom_value</value></additional_field></additional_fields><time_zone>Kyiv</time_zone><locale>en</locale></user>
```

**JSON Request Example**

```bash
curl -i -X POST -d '{"user":{"login":"111111losj","email":"111111losj@test.test","first_name":"1111","last_name":"1311","password":"password_test1","user_group_id":"1","billing_plan_id":"1","role_ids":["1","2"],"additional_fields":[{"additional_field":{"name":"additional_field_name","value":"custom_value"}}]}'} -u user:userpass http://onapp.test/users.xml -H 'Accept: application/xml' -H 'Content-type: application/xml'
```

Returns HTTP 201 on successful creation, or HTTP 422 if a user with such a login/email already exists.

**Where:**

- **email** - user's email address
- **login** - login of the user. It can consist of 2-40 characters, letters [A-Za-z], digits [0-9], dash [-], lower dash [-], [@]. You can use both lower- and uppercase letters. The dash [-] and [@] symbols are not allowed as the first characters of the login name.
- **password** - user's password. (min – 6 characters)
- **first_name** - user's first name
- **last_name** - user's last name
- **role** - assigns a role to a user
- **time_zone** - time zone of the user. Set by default
- **locale** - local of the user. Set by default
- **status** – user's status (active, suspended, etc)
- **bucket_id** – set by default, if not selected
- **additional field** – an array of custom fields assigned to the user, where:
  - **name** - the name of a particular additional field
  - **value** - the value which you want to assign to this additional field
- **role_ids** – an array of the role IDs, assigned to the user
- **user_group_id** – ID of the group, to which the user is attached
- **suspend_after_hours** – time in hours, after which the user will be suspended
- **suspend_at** – time in [YYYY][MM][DD] T[hh][mm][ss]Z format, when the user will be suspended
3.14.3 Edit VCD User

To edit a VCD user, use this request:

```plaintext
PUT /users/:id.xml
PUT /users/:id.json
```

**XML Request Example**

```bash
curl -i -X PUT -d "<user><email>somemail@example.com</email><first_name>NewName</first_name><last_name>NewLastName</last_name><password>qwe123</password><user_group_id>36</user_group_id><billing_plan_id>2</billing_plan_id><role_ids type="array"><role_id>1</role_id></role_ids><additional_fields type="array"><name>additional_field_name</name><value>custom_value</value></additional_fields><suspend_at>2011-08-01 12:47:08</suspend_at><registered_yubikey>true</registered_yubikey></user>"
-u user:userpass http://onapp.test/users/12.xml
-H 'Accept: application/xml'
-H 'Content-Type: application/xml'
```

**JSON Request Example**

```bash
curl -i -X PUT -H 'Accept: application/json' -H 'Content-Type: application/json' -u user:password -d '{"user":{"email":"1111111losj@test.test","first_name":"1111","last_name": "1311","password":"changeme","user_group_id":"1","billing_plan_id":"1","role_ids":["1","2"],"additional_fields": [{"additional_field": {"name":"additional_field_name","value":"custom_value"}}]}}'
```

**Where:**

- **email** - user's email address
- **first_name** - user's first name
- **last_name** - user's last name
- **password** - user's password. (min – 6 characters)
- **user_group_id** - ID of the group, to which the user is attached
- **bucket_id** - ID of the bucket assigned to this user
- **role_ids** - an array of the role IDs, assigned to the user
- **additional_field** – an array of custom fields assigned to the user, where:
  - **name** - the name of a particular additional field
  - **value** - the value which you want to assign to this additional field
- **suspend_at** - time in [YYYY][MM][DD] T[hh][mm][ss]Z format, when the user will be suspended
- **registered_yubikey** - set to 'true' if you want to enable logging in using a Yubikey for this user, otherwise set to 'false'. For the API request that adds a YubiKey, refer to Add YubiKey to User.

- To disable user auto-suspending, leave the suspend_at field empty.
- Users with API key instead of password are not allowed to see their login and change their password.
3.14.4 Delete VCD User

To delete a VMware Cloud Director user account from the cloud, use the following request:

DELETE /users/:id.xml
DELETE /users/:id.json

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```

Where:

- `take_ownership`: true, if you want to transfer all resources associated with the user to your account, otherwise, false

Returns HTTP 204 response on the successful deletion or HTTP 404 when a user with the specified ID is not found.

3.15 vApps API

This section provides the API calls you can use to manage the vApps imported from the VMware Cloud Director.

3.15.1 Get List of vApps

To view the list of vApps, use the following request:

GET /vapps.xml
GET /vapps.json

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```
XML Output Example

```
<vapps type="array">
  <vapp>
    <created_at type="datetime">2015-03-31T11:14:15+00:00</created_at>
    <id type="integer">1</id>
    <identifier>vapp-0b38fd9a-0ba6-41d2-95d2-4d40f3d769d6</identifier>
    <name>AD</name>
    <status>booted</status>
    <updated_at type="datetime">2015-03-31T14:47+00:00</updated_at>
    <user_id type="integer">11</user_id>
    <vapp_template_id nil="true"/>
    <vdc_id type="integer">4</vdc_id>
    <deployed type="boolean">false</deployed>
    <description>This is a description of the vApp</description>
  </vapp>
  ...
</vapps>
```

Where:

- **created_at** - time when the vApp was created, in [YYYY][MM][DD][hh][mm][ss]Z
- **id** - ID of the vApp
- **identifier** - identifier of the vApp
- **name** - name of the vApp
- **status** - the status of the vApp. A vApp can have the following statuses:
  - FAILED_CREATION - the vApp could not be created
  - UNRESOLVED - the vApp is damaged and cannot be controlled by vCloud
  - RESOLVED - the vApp has been created but it does not contain VSs
  - SUSPENDED - the vApp has been suspended
  - POWERED_ON - all the VSs in the vApp are on
  - WAITING_FOR_INPUT - the vApp is waiting for user input
  - UNKNOWN - the vApp is in a state that is identified but is not known to the system
  - UNRECOGNIZED - the vApp is in a state that cannot be identified by the system
  - POWERED_OFF - all the VSs in the vApp are on
  - INCONSISTENT_STATE - the vApp is in an inconsistent state. This status appears when
    the vApp was edited from the vSphere associated with the VCD in which the vApp resides,
    therefore, the vSphere and VCD databases are not yet fully synchronized.
  - MIXED - the VSs in the vApp have different power statuses: some are on and some are off
- **updated_at** - time when the vApp was updated, in [YYYY][MM][DD][hh][mm][ss]Z
- **user_id** - ID of the user associated with the vApp
- **vapp_template_id** - ID of the template on which the vApp was built
- **vdc_id** - ID of the datacenter on which the vApp was created
- **deployed** - true, if the vApp was deployed and false if the vApp was composed
  - **description** - the description of the vApp
v. 6.0

- added the *description* parameter

### 3.15.2 Get List of vApp VSs

To get the list of a vApp VSs, use the following request:

GET /vapps/:vapp_id/virtual_machines.xml
GET /vapps/:vapp_id/virtual_machines.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```xml
<virtual_machines>
  <virtual_machine>
    <name>vm1</name>
    <description>This is the description of virtual machine 1</description>
    <datacenter>dc1</datacenter>
    <networks>
      <network>net1</network>
    </networks>
    <storage>
      <storage_pool>sampool1</storage_pool>
    </storage>
  </virtual_machine>
  <virtual_machine>
    <name>vm2</name>
    <description>This is the description of virtual machine 2</description>
    <datacenter>dc2</datacenter>
    <networks>
      <network>net2</network>
    </networks>
    <storage>
      <storage_pool>sampool2</storage_pool>
    </storage>
  </virtual_machine>
</virtual_machines>
```
<virtual_machines type="array">
    <virtual_machine>
        <add_to_marketplace nil="true"/>
        <admin_note nil="true"/>
        <allowed_hot_migrate nil="true"/>
        <allowed_swap type="boolean" true"/>

        <allowed_hot_migrate nil="true"/>
        <allowed_swap type="boolean" true"/>
        <autoscale_service nil="true"/>
        <booted type="boolean" true"/>
        <built type="boolean" true"/>
        <allow...
<disallowed_primary type="boolean">false</disallowed_primary>
<gateway>10.1.1.254</gateway>
<hypervisor_id nil="true"/>
<ip_address_pool_id nil="true"/>
<network_address nil="true"/>
<pxe type="boolean">false</pxe>
<updated_at type="datetime">2016-02-01T11:46:20+00:00</updated_at>
<user_id nil="true"/>
<free type="boolean">false</free>
<netmask>255.255.255.0</netmask>
</ip_address>
</ip_addresses>
<monthly_bandwidth_used>0</monthly_bandwidth_used>
<total_disk_size type="integer">8</total_disk_size>
<support_incremental_backups>
<cpu_priority type="integer">1</cpu_priority>
</support_incremental_backups>
<built_from_iso type="boolean">false</built_from_iso>
<acceleration type="boolean">false</acceleration>
<acceleration_status>Inactive</acceleration_status>
<price_per_hour type="float">0.0</price_per_hour>
<price_per_hour_powered_off type="float">0.0</price_per_hour_powered_off>
</virtual_machine>
</virtual_machines>

Where:

add_to_marketplace — empty for VSs; used for edge servers only
admin_note — an optional note of the administrator
allowed_hot_migrate — true if the template, on which the VS is based, supports hot migration; otherwise false
allowed_swap — true if swap disk is allowed (depends on the template the VS is based on); otherwise false
booted — true if the VS is running, otherwise false
built — true if the VS is built, otherwise false
cores_per_socket - the amount of cores per socket
cpu_shares — CPU priority in percent's
cpu.Sockets - this output parameter does not currently apply to vCloud VSs
**cpu_threads** - the amount of CPU threads per core. This parameter can be set for KVM compute resources only by those users who have Enable CPU topology permission granted.

**cpu_units** - the amount of CPU units per core if the CPU priority is replaced with CPU units in user bucket.

**cpus** — the number of allocated CPU cores

**created_at** — the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

**customer_network_id** - ID of a customer network

**deleted_at** - time when the VS was deleted

**edge_server_type** - true if this is the edge server

**enable_autoscale** — true if autoscaling is allowed for this VS

**enable_monitor** - deprecated attribute; will be removed in upcoming release

**firewall_notrack** - true if the NOTRACK rule is set in iptables

**hostname** — the name of your host

**hypervisor_id** — the ID of the compute resource used by this VS

**id** — the VS ID

**identifier** — the VS identifier

**initial_root_password** — the VS root password

**initial_root_password_encrypted** - true, if the root password is encrypted, otherwise false.

**iso_id** - the ID of the ISO the VS is based on

**label** — the VS label

**local_remote_access_ip_address** - IP address used for remote access

**local_remote_access_port** — the port ID used for console access

**locked** — true if the VS is locked; otherwise false

**memory** — the RAM size allocated to this VS

**min_disk_size** — the minimum disk size required to build a VS from a specified template

**note** — an optional reminder for this VS made by a user account

**operating_system** — operating system used by the VS

**operating_system_distro** — the distribution of the OS from which this VS is built

**preferred_hvs** - the array of preferable compute resources based on compute zone that meet some VS configuration settings

**recovery_mode** — true if recovery mode allowed. Otherwise false

**remote_access_password** — the password for the remote access

**service_password** - service account password

**state** – parameter reserved for future use

**storage_server_type** - true if this is a storage server

**strict_virtual_machine_id** — the ID of a virtual server that will never reside on the same compute resource with this VS

**suspended** — true if VS is suspended, otherwise false

**template_id** — the ID of the template the VS is based on

**template_label** — the name of the template from which this VS is built

**updated_at** — the date when the VS was updated in the [YYYY][MM][DD][T][hh][mm][ss]Z format
user_id — the ID of a user assigned to this VS
vip — true if the VS has VIP status (gives migration priority)
xen_id — the VS ID set by the virtualization engine

ip_addresses - an array of IP addresses assigned to this VS and their details:
  address - IP address
  broadcast - broadcast address
  created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
  customer_network_id - the ID of the customer VLAN the IP address belongs to
  disallowed_primary - true if not allowed to be used as primary, otherwise false
  gateway - gateway address
  hypervisor_id - the ID of a compute resource the IP address is associated with
  id - the ID of the IP address
  ip_address_pool_id - ID of the IP address pool the IP address is associated with
  network_address - the address of the network
  network_id - the ID of the network
  pxe - true, if this address can be used for cloudbooting a compute resource
  updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
  user_id - the ID of the user this IP address is assigned to
  free - true if free, otherwise false
  netmask - netmask for the IP address

monthly_bandwidth_used - VS monthly bandwidth in KB

total_disk_size — the total disk size in GB of all disks assigned to VS

price_per_hour - server’s price per hour

price_per_hour_powered_off - price per hour when server is powered off

support_incremental_backups - 1, if virtual server supports incremental backups, and 0 if it does not

cpu_priority - this is a new parameter reserved for further use; currently will have the same value as cpu_shares

3.15.3 Get vApp Details
To view the details of a vApp, use the following request:

GET /vapps/:id.xml
GET /vapps/:id.json

XML Request Example

```
```

JSON Request Example

XML Output Example

```
<vapp>
  <created_at type="datetime">2015-03-31T11:14:15+00:00</created_at>
  <id type="integer">1</id>
  <identifier>vapp-0b38fd9a-0ba6-41d2-95d2-4d40f3d769d6</identifier>
  <name>AD</name>
  <status>booted</status>
  <updated_at type="datetime">2015-03-31T11:14:47+00:00</updated_at>
  <user_id type="integer">11</user_id>
  <vapp_template_id nil="true"/>
  <vdc_id type="integer">4</vdc_id>
  <deployed type="boolean">false</deployed>
  <description>This is a description of the vApp</description>
</vapp>
```

Where:

- **created_at** - time when the vApp was created, in [YYYY][MM][DD][T][hh][mm][ss]Z
- **id** - ID of the vApp
- **identifier** - identifier of the vApp
- **name** - name of the vApp
- **status** - the status of the vApp. A vApp can have the following statuses:
  - FAILED_CREATION - the vApp could not be created
  - UNRESOLVED - the vApp is damaged and cannot be controlled by vCloud
  - RESOLVED - the vApp has been created but it does not contain VSs
  - SUSPENDED - the vApp has been suspended
  - POWERED_ON - all the VSs in the vApp are on
  - WAITING_FOR_INPUT - the vApp is waiting for user input
  - UNKNOWN - the vApp is in a state that is identified but is not known to the system
  - UNRECOGNIZED - the vApp is in a state that cannot be identified by the system
  - POWERED_OFF - all the VSs in the vApp are off
  - INCONSISTENT_STATE - the vApp is in an inconsistent state. This status appears when the vApp was edited from the vSphere associated with the VCD in which the vApp resides, therefore, the vSphere and VCD databases are not yet fully synchronized.
  - MIXED - the VSs in the vApp have different power statuses: some are on and some are off
- **storage_lease_expiration** - vapp's storage lease expiration
- **updated_at** - time when the vApp was updated, in [YYYY][MM][DD][T][hh][mm][ss]Z
- **user_id** - ID of the user associated with the vApp
- **vapp_template_id** - ID of the template on which the vApp was built
- **vdc_id** - ID of the datacenter on which the vApp was created
- **deployed** - true, if the vApp was deployed and false if the vApp was composed
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

description - the description of the vApp

Page History
v. 6.0
- added the description parameter

3.15.4 Get List of vApp VSs Start/Stop Order
To get the list of VSs start/stop order during the vApp start/stop, use the following request:
GET /vapps/:vapp_id/startup_items.xml
GET /vapps/:vapp_id/startup_items.json

XML Request Example
```
```

JSON Request Example
```
```

XML Output Example
```
<vapps_startup_items type="array">
  <vapps_startup_item>
    <id type="integer">2</id>
    <vapp_id type="integer">5</vapp_id>
    <virtual_machine_id type="integer">9</virtual_machine_id>
    <vm_name>virtual_server_label</vm_name>
    <order type="integer">1</order>
    <start_action>powerOn</start_action>
    <start_delay type="integer">0</start_delay>
    <stop_action>powerOff</stop_action>
    <stop_delay type="integer">0</stop_delay>
    <created_at type="dateTime">2018-03-20T16:06:15+00:00</created_at>
    <updated_at type="dateTime">2018-03-20T16:06:15+00:00</updated_at>
  </vapps_startup_item>
  ...
</vapps_startup_items>
```

Where:
- **vapps_startup_items** - the array of startup items
- **vapps_startup_item** - the array of startup item parameters
- **id** - the ID of the startup item
- **vapp_id** - the ID of the vApp
- **virtual_machine_id** - the ID of the virtual server
vm_name - the label of the virtual server that belongs to the vApp

order - the number that indicates the order in which to start and stop the virtual server

Virtual servers with lower numbers are started first and stopped last. You cannot specify negative numbers. Virtual servers with the same numbers are started and stopped at the same time.

start_action - the powerOn action to apply to the virtual server when the vApp is started

start_delay - the delay in seconds after starting one virtual server and before starting the next virtual server

stop_action - the action to apply to the virtual server when the vApp is stopped. The available actions include:

- powerOff - to power off the VS forcefully
- guestShutdown - to shut down the VS gracefully

stop_delay - the delay in seconds to wait after stopping one virtual server and before stopping the next virtual server

created_at - the date when the startup item was created in the [YYYY][MM][DD]T[hh][mm][ss] format

updated_at - the date when the startup item was updated in the [YYYY][MM][DD]T[hh][mm][ss] format

3.15.5 Deploy vApp

To deploy a vApp, use the following request:

POST /vapps.xml

POST /vapps.json

XML Request example:

curl -i -X POST -u 'user:userpass' -H 'Accept: application/xml' -H 'Content-Type: application/xml' http://onapp.test/vapps.xml -d '<vapp><name>APIvApp</name><description>This is a description of the vApp</description><vdc_id>64</vdc_id><vapp_template_id>390</vapp_template_id><virtual_machines><virtual_machine_0><id>vm-7sa7228c-94f6-470c-8798-c20c0bdd1c90</id><name>CentOS7</name><cpus>1</cpus><cores_per_socket>1</cores_per_socket><memor y>512</memory><storage_policy>387</storage_policy><harddisks><hard_disk_1><instance_id>5</instance_id><disk_space>3</disk_space></hard_disk_1></hard_disks><nics><nic_0><id>0</id><network_id>12</network_id></nic_0></nics></virtual_machine_0></virtual_machines></vapp>'

JSON Request example:
curl -i -X POST -u 'user:userpass' -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/vapps.json -d '{"vapp":{"name":"APIvApp","description":"This is a description of the vApp","vdc_id":"64","vapp_template_id":"390","virtual_machines":{"virtual_machine_0":{"id":"vm-7sa7Z28c-94f6-470c-8798-c20c0bd1c90","name":"CentOS7","cpus":"1","cores_per_socket":"1","memory":"512","storage_policy":"387","hard_disks":{"hard_disk_1":{"instance_id":"5","disk_space":"3"}},"nics":{"nic_0":{"id":"0","network_id":"12"}}}}}'

Where:
- **name** - name of the vApp
- **description** - the description of the vApp
- **vdc_id** - ID of the datacenter on which the vApp will be created
- **vapp_template_id** - ID of the template on which the vApp will be built
- **virtual_machines** - array of parameters associated with the VS
  - **id** - ID of the VS
  - **name** - choose a name for the VS
  - **cpus** - set the number of cores
  - **core_per_socket** - set the number of cores per socket
  - **memory** - the amount of RAM allocated to this VS in Mb
  - **storage_policy** - the virtual server’s storage policy
  - **hard_disks** - array of parameters associated with the VS disks
    - **instance_id** - the ID of the corresponding disk that is available via the Get List of vApp Templates request
    - **disk_space** - set the disk’s size
    - **storage_policy** - the disk’s storage policy
  - **nics** - array of parameters associated with the NICs
    - **nic** - the sequence number of NIC
    - **id** - the ID of NIC
    - **network_id** - the ID of the network to which the NIC will be connected

**Page History**

v. 6.0

Added the **description** and **instance_id** parameters.

Added the **nic** and **id** parameters to the array of parameters associated with the NICs.

### 3.15.6 Compose vApp

To compose a vApp, use the following request:

- POST /vapps/compose.xml
- POST /vapps/compose.json

**XML Request Example**
curl -i -X POST http://onapp.test/vapps/compose.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<vapp><blank_vapp>0</blank_vapp><name>vapp_name</name><description>This is a description of the vApp</description><vdc_id>9</vdc_id><vapp_template_ids><vapp_template_id>1</vapp_template_id></vapp_template_ids><vapp_ids><vapp_id>3</vapp_id></vapp_ids><cpus>1</cpus><cores_per_socket>1</cores_per_socket><memory>512</memory><storage_policy>2</storage_policy><hard_disks><hard_disk_1><instance_id>5</instance_id><disk_space>3</disk_space><storage_policy>4</storage_policy></hard_disk_1></hard_disks><nics><nic_0><id>4</id><network_id>19</network_id><adapter_type>VMXNET3</adapter_type></nic_0></nics><boot_vm>1</boot_vm>'

JSON Request Example

```json
curl -i -X POST http://onapp.test/vapps/compose.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"vapp":{"blank_vapp":"0", "name":"vApp_Name", "description":"This is a description of the vApp", "vdc_id":"421", "vapp_template_ids":["374"], "vapp_ids": ["1256", "1989"], "virtual_machines": ["CentOS7_vm", {"cpu":1, "memory":512, "storage_policy":845, "hard_disks": [{"instance_id":2000, "bus_sub_type":"lsilogic", "disk_space":3, "storage_policy":845}], "nics": [{"nic_0": {"id":0, "network_id":"", "adapter_type":"VMXNET3"}}, {"boot_vm":true}]}, {"virtual_machine_1": {"id":vm-314738fr, "name":"CentOS7_vs", "cpu":1, "memory":512, "storage_policy":845, "hard_disks": [{"instance_id":2000, "bus_sub_type":"lsilogic", "disk_space":3, "storage_policy":845}], "nics": [{"nic_0": {"id":2, "network_id":56, "adapter_type":"VMXNET3"}, {"boot_vm":true}]}}]}
```

Where:

- **vapp** - the array of parameters to compose a vApp
- **blank_vapp** - set 1 to create a blank vApp, otherwise, set 0
- **name** - the vApp label
- **description** - the description of the vApp
- **vdc_id** - the virtual data center ID
- **vapp_template_ids** - the array of vApp templates IDs. All VSs that are built on these templates will be copied to your new vApp.
- **vapp_template_id** - the vApp template ID
- **vapp_ids** - the array of vApps IDs. All VSs within the specified vApps will be copied to your new vApp.
- **vapp_id** - the vApp ID
- **virtual_machines** - the array of parameters associated with the VS
  - **id** - the ID of the VS
  - **name** - edit the name of the VS
  - **cpus** - set the number of cores
  - **cores_per_socket** - set the number of cores per socket
  - **memory** - the amount of RAM allocated to this VS in Mb
**storage_policy** - the virtual server’s storage policy that is a default data store ID. If Fast Provisioning is not enabled for the previously selected VDC, you can select a different data store for the VS's disks.

**hard_disks** - the array of parameters associated with the VS disks

  - **instance_id** - the ID of the corresponding disk that is available via the [Get List of vApp Templates](#) request
  - **disk_space** - set the disk size in Gb
  - **bus_sub_type** - the bus sub type of the disk
  - **storage_policy** - the disk storage policy that is a data store ID. This option is available only if the selected VDC has Fast Provisioning disabled. If you do not select a data store, the disk is built on the default data store.

**nics** - the array of parameters associated with the NICs

  - **id** - the ID of the NIC
  - **network_id** - the ID of the network to which the NIC will be connected
  - **adapter_type** - the network adapter type provided for the VS that can be one of the following values:
    - Vlance
    - E1000
    - E1000E
    - VMXNET
    - VMXNET2
    - VMXNET3
    - FLEXIBLE

  - **boot_vm** - set 1 if the VS should be switched on after the vApp deployment, otherwise, set 0

**Page History**

**v. 6.1**

- added the following parameters:
  - virtual_machines array
  - boot_vm

**v. 6.0**

- added the description parameter

### 3.15.7 Recompose vApp

To recompose a vApp, use the following request:

```
PUT /vapps/:id/recompose.xml
PUT /vapps/:id/recompose.json
```

**XML Request example:**
curl -X PUT -u user:userpass http://onapp.test/vapps/12/recompose.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -d '<vapp><vapp_template_id>1</vapp_template_id><virtual_machines><virtual_machine_0><id>vm-11111111-8885-4276-479c724b9d6e</id><name>Example</name><cpu>1</cpu><cores_per_socket>1</cores_per_socket><memory>512</memory><storage_policy>2</storage_policy><hard_disks><hard_disk_1><instance_id>5</instance_id><disk_space>3</disk_space><storage_policy>4</storage_policy></hard_disk_1></hard_disks><nics><network_id>25</network_id><adapter_type>E1000</adapter_type></nics><vcloud_guest_customization><computer_name>example</computer_name><enabled>1</enabled><admin_password_enabled>1</admin_password_enabled><admin_password_auto>0</admin_password_auto><admin_password=password><admin_password></admin_password></vcloud_guest_customization><recipe_ids type="array"><recipe_id>4</recipe_id><recipe_id></recipe_ids><virtual_machine_0></virtual_machines></vapp>'

JSON Request example:

curl -X PUT -u user:userpass http://onapp.test/vapps/12/recompose.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"vapp": {"vapp_template_id": "1", "virtual_machines": [{"id": "vm-a11111-8885-4276-479c724b9d6e", "name": "Example", "cpu": 1, "cores_per_socket": 1, "memory": 1024, "storage_policy": 2, "hard_disks": [{"instance_id": 5, "disk_space": 3, "storage_policy": 6}], "nics": [{"network_id": 1, "adapter_type": "E1000"}], "vcloud_guest_customization": {"enabled": 1, "admin_password_enabled": 1, "admin_password_auto": 0, "admin_password": "password", "computer_name": "example"}, "recipe_ids": [4, 5], "custom_recipe_variables": {"variable_0": {"name": "xxx", "value": "xy", "enabled": true}}, "boot_vm": 1, "disable_guest_customization_after_run": 0}}]}

Where:

- **vapp_template_id** - the ID of the template on which the vApp will be built
- **virtual_machines** - the array of parameters associated with the VSs
  - **id** - the ID of the VS
  - **name** - edit the name for the VS
  - **cpus** - set the number of cores
  - **cores_per_socket** - set the number of cores per socket
  - **memory** - the amount of RAM allocated to this VS in Mb
  - **storage_policy** - the virtual server's storage policy that is a default data store ID. If Fast Provisioning is not enabled for the previously selected VDC, you can select a different data store for the VS's disks.
  - **hard_disks** - the array of parameters associated with the VS disks
    - **instance_id** - the ID of the corresponding disk that is available via the Get List of vApp Templates request
    - **disk_space** - set the disk size in Gb
    - **storage_policy** - the disk storage policy that is a data store ID. This option is available only if the selected VDC has Fast Provisioning disabled. If you do not select a data store, the disk is built on the default data store.
  - **nics** - the array of parameters associated with the NICs
network_id - the ID of the network to which the NIC will be connected

adapter_type - the network adapter type provided for the VS that can be one of the following values:

- Vlance
- E1000
- E1000E
- VMXNET
- VMXNET2
- VMXNET3
- FLEXIBLE

vcloud_guest_customization - array of parameters associated with guest customization
  
  computer_name - VS’s computer name
  
  enabled - set ‘true’ if guest customization should be enabled for the VS, otherwise, set ‘false’
  
  admin_password_enabled - set ‘true’ if the local admin password should be allowed, otherwise, set ‘false’
  
  admin_password - enter the password of the administrator
  
  admin_password_auto - set ‘true’ if the admin password should be generated automatically, otherwise, set ‘false’

recipe_ids - the IDs of the recipes that are to be applied to the VS

custom_recipe_variables - array of parameters associated with custom variables
  
  name - the name of the custom variable
  
  value - the value of the custom variable
  
  enabled - set to ‘true’ if the custom variable should be enabled, otherwise, set ‘false’

disable_guest_customization_after_run - set ‘true’ if guest customization for this VS should be disabled after vApp deployment, otherwise, set ‘false’

boot_vm - set ‘true’ if the VS should be switched on after vApp deployment, otherwise, set ‘false’

Page History

v. 5.3
  
  added parameters related to guest customization and recipes

v. 5.2
  
  added the following parameters:
    
    o virtual_machines
    o id
    o name
    o cpus
    o cores_per_socket
    o memory
    o storage_policy
3.15.8 Edit vApp

To edit a vApp, use the following request:

PUT /vapps/:id/edit.xml
PUT /vapps/:id/edit.json

XML Request Example

```
curl -i -X PUT -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<vapp><name>test.vapp</name><description>This is a description of the vApp</description></vapp>' --url http://onapp.test/vapps/5.xml
```

JSON Request Example

```
curl -i -X PUT -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"vapp":{"name":"test.vapp","description":"This is a description of the vApp"}}' --url http://onapp.test/vapps/5.json
```

Where:

- `name` - the name of the vApp
- `description` - the description of the vApp

---

3.15.9 Start vApp

To start a vApp, use the following request:

POST /vapps/:id/start.xml
POST /vapps/:id/start.json

XML Request Example

```
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/start.xml
```

JSON Request Example

```
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/start.json
```
3.15.10 Stop vApp

To stop a vApp forcefully, use the following request:

POST /vapps/:id/stop.xml
POST /vapps/:id/stop.json

XML Request Example

```
```

JSON Request Example

```
```

3.15.11 Start/Stop vApp VSS

To schedule actions for starting/stopping virtual servers when the vApp is being started/stopped, use the following request:

PUT /vapps/:vapp_id/startup_items.xml
PUT /vapps/:vapp_id/startup_items.json

XML Request Example

```
curl -i -X PUT -u user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml' http://onapp.test/vapps/12/startup_items.xml -d '<vapp><startup_items_attributes><item_1><vm_name>virtual_server_name1</vm_name><order>1</order><start_action>powerOn</start_action><start_delay>5</start_delay><stop_action>powerOff</stop_action><stop_delay>5</stop_delay><id>267</id></item_1><item_2><vm_name>virtual_server_name2</vm_name><order>2</order><start_action>powerOn</start_action><start_delay>5</start_delay><stop_action>powerOff</stop_action><stop_delay>5</stop_delay><id>266</id></item_2></startup_items_attributes></vapp>'
```

JSON Request Example

```
curl -i -X PUT -u user:userpass -H 'Accept: application/json' -H 'Content-type: application/json' http://onapp.test/vapps/12/startup_items.json -d '{"vapp": {"startup_items_attributes": [{"vm_name": "virtual_server_name1", "order": "1", "start_action": "powerOn", "start_delay": "5", "stop_action": "powerOff", "stop_delay": "5", "id": "267"}, {"vm_name": "virtual_server_name2", "order": "1", "start_action": "powerOn", "start_delay": "5", "stop_action": "powerOff", "stop_delay": "5", "id": "266"}]}}}'
```

Where:

- `startup_items_attributes` - the array of items for starting/stopping a virtual server
- `item_x` - the array of attributes for starting/stopping a virtual server where x should be a unique number for each item within the request
- `vm_name` - the label of the virtual server that belongs to the vApp
order - the number that indicates the order in which to start and stop the virtual server

Virtual servers with lower numbers are started first and stopped last. You cannot specify negative numbers. Virtual servers with the same numbers are started and stopped at the same time.

start_action - the powerOn action to apply to the virtual server when the vApp is started. To apply no start action, skip this parameter.

start_delay - the delay in seconds after starting one virtual server and before starting the next virtual server

stop_action - the action to apply to the virtual server when the vApp is stopped. The available actions include:
- powerOff - to power off the VS forcefully
- guestShutdown - to shut down the VS gracefully

stop_delay - the delay in seconds to wait after stopping one virtual server and before stopping the next virtual server

id - the ID of the startup item that is available via the Get List of vApp VSs Start/Stop Order request

3.15.12 Delete vApp

To delete a vApp, use the following request:

DELETE /vapps/:id.xml
DELETE /vapps/:id.json

XML Request Example

curl -i -X DELETE -u user:userpass http://onapp.test/vapps/12.xml

JSON Request Example

curl -i -X DELETE -u user:userpass http://onapp.test/vapps/12.json

3.15.13 Create vApp with Guest Customization and Recipes

To create a vApp, use the following request:

POST /vapps.xml
POST /vapps.json

XML Request Example
curl -i -X POST -u user:userpass http://onapp.test/vapps.xml -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d '<vapp><name>ExampleVApp</name><vdc_id>2</vdc_id><vapp_template_id>5</vapp_template_id><virtual_machines><virtual_machine_0><id>vm-88dd-03fbfa33f0c0</id><name>VM1</name><cpus>2</cpus><cores_per_socket>1</cores_per_socket><memory>512</memory><hard_disks><hard_disk_1><disk_space>6</disk_space><storage_policy>3</storage_policy></hard_disk_1></hard_disks><nics><nic_0><network_id></network_id></nic_0></nics><vcloud_guest_customization><computer_name>vm-1</computer_name><enabled>true</enabled><admin_password_enabled>true</admin_password_enabled><admin_password>23</admin_password><disable_guest_customization_after_run>false</disable_guest_customization_after_run><boot_vm>true</boot_vm></vcloud_guest_customization><recipe_ids type="array"><recipe_id>3</recipe_id></recipe_ids><custom_recipe_variables><variable_0><name>x</name><value>1</value><enabled>true</enabled></variable_0><variable_1><name>y</name><value>2</value><enabled>false</enabled></variable_1></custom_recipe_variables></virtual_machine_0><virtual_machine_1><id>vm-b124-15700d40073b</id><name>VM2</name><cpus>4</cpus><cores_per_socket>2</cores_per_socket><memory>1024</memory><hard_disks><hard_disk_1><disk_space>31</disk_space><storage_policy>3</storage_policy></hard_disk_1></hard_disks><nics><nic_0><network_id></network_id></nic_0></nics><vcloud_guest_customization><computer_name>vm-2</computer_name><enabled>true</enabled><admin_password_enabled>true</admin_password_enabled><admin_password_auto>true</admin_password_auto><admin_password>23</admin_password><disable_guest_customization_after_run>true</disable_guest_customization_after_run><boot_vm>false</boot_vm></vcloud_guest_customization><recipe_ids type="array"><recipe_id>1</recipe_id><recipe_id>2</recipe_id></recipe_ids></virtual_machine_1></virtual_machines></vapp>

JSON Request Example

curl -i -X POST -u user:userpass http://onapp.test/vapps.json -H 'Accept: application/json' -H 'Content-Type: application/json' -d '{"vapp": {"name": "ExampleVApp", "vdc_id": 2, "vapp_template_id": 5, "virtual_machines": [{"virtual_machine_0": {"id": "vm-88dd-03fbfa33f0c0", "name": "VM1", "cpus": 2, "cores_per_socket": 1, "memory": 512, "hard_disks": [{"disk_space": 6, "storage_policy": 3}], "nics": [{"network_id": null}]}, "vcloud_guest_customization": {"computer_name": "vm-1", "enabled": true, "admin_password_enabled": true, "admin_password": 23}, "recipe_ids": [3], "custom_recipe_variables": {"variable_0": {"name": "x", "value": 1, "enabled": true}, "variable_1": {"name": "y", "value": 2, "enabled": false}}, "disable_guest_customization_after_run": false, "boot_vm": true}, "virtual_machine_1": {"id": "vm-b124-15700d40073b", "name": "VM2", "cpus": 4, "cores_per_socket": 2, "memory": 1024, "hard_disks": [{"disk_space": 31, "storage_policy": 3}], "nics": [{"network_id": null}], "vcloud_guest_customization": {"computer_name": "vm-2", "enabled": true, "admin_password_enabled": true, "admin_password": 23}, "recipe_ids": [1, 2], "disable_guest_customization_after_run": false, "boot_vm": false}}}'

Where:
- name - name of the vApp
- vdc_id - ID of the datacenter on which the vApp will be created
- vapp_template_id - ID of the template on which the vApp will be built
- virtual_machines - array of parameters associated with the VSs
id - ID of the VS

name - choose a name for the VS

cpus - set the number of cores

cores_per_socket - set the number of cores per socket

memory - the amount of RAM allocated to this VS in Mb

storage_policy - the virtual server's storage policy

hard_disks - array of parameters associated with the VS disks

disk_space - set the disk's size

storage_policy - the disks's storage police

nics - array of parameters associated with the NICs

network_id - the ID of the network to which the NIC will be connected

vcloud_guest_customization - array of parameters associated with guest customization

computer_name - VS's computer name

enabled - set 'true' if guest customization should be enabled for the VS, otherwise, set 'false'

admin_password_enabled - set 'true' if the local admin password should be allowed, otherwise, set 'false'

admin_password - enter the password of the administrator

admin_password_auto - set 'true' if the admin password should be generated automatically, otherwise, set 'false'

recipe_ids - the IDs of the recipes that are to be applied to the VS

custom_recipe_variables - array of parameters associated with custom variables

name - the name of the custom variable

value - the value of the custom variable

enabled - set to 'true' if the custom variable should be enabled, otherwise, set 'false'

disable_guest_customization_after_run - set 'true' if guest customization for this VS should be disabled after vApp deployment, otherwise, set 'false'

boot_vm - set 'true' if the VS should be switched on after vApp deployment, otherwise, set 'false'

3.15.14 Change vApp Owner

To change the owner of a vApp, use the following request:

PUT /vapps/:id/owner.xml

PUT /vapps/:id/owner.json

XML Request Example

curl -i -X PUT http://onapp.test/vapps/12/owner.xml -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d '<owner_change><new_owner_id>42</new_owner_id></owner_change>'

JSON Request Example
Where:

*id* - the ID of the new owner of the vApp

### 3.15.15 Shutdown vApp

To shut down a vApp gracefully, use the following request:

```bash
POST /vapps/:id/shutdown.xml
POST /vapps/:id/shutdown.json
```

**XML Request Example**

```bash
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/shutdown.xml
```

**JSON Request Example**

```bash
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/shutdown.json
```

### 3.15.16 Suspend vApp

To suspend a vApp, use the following request:

```bash
POST /vapps/:id/suspend.xml
POST /vapps/:id/suspend.json
```

**XML Request Example**

```bash
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/suspend.xml
```

**JSON Request Example**

```bash
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/suspend.json
```

### 3.15.17 Unsuspend vApp

To unsuspend a vApp, use the following request. All the VSs in the vApp will be powered off. If you want to unsuspend the vApp and start up the VSs in it use the Start vApp API request.

```bash
POST /vapps/:id/unsuspend.xml
POST /vapps/:id/unsuspend.json
```
XML Request Example

```
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/unsuspend.xml
```

JSON Request Example

```
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/unsuspend.json
```

### 3.15.18 Reboot vApp

To reboot a vApp, use the following request:

- POST `/vapps/:id/reboot.xml`
- POST `/vapps/:id/reboot.json`

**XML Request Example**

```
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/reboot.xml
```

**JSON Request Example**

```
curl -i -X POST -u user:userpass --url http://onapp.test/vapps/12/reboot.json
```

### 3.16 vApp Networks API

This section provides the API calls you can use to manage vApp networks imported from vCloud.

#### 3.16.1 Get List of vApp Networks

To view the list of vApp networks, use the following request:

- GET `/settings/vapp_networks.xml`
- GET `/settings/vapp_networks.json`

**XML Request Example**

```
```

**JSON Request Example**

XML Output Example

```xml
<vapp_networks type="array">
  <vapp_network>
    <created_at type="datetime">2016-02-13T10:35:21+02:00</created_at>
    <default_nat_rule_number type="integer">9999</default_nat_rule_number>
    <default_outside_ip_address_id nil="true"/>
    <dns_suffix nil="true"/>
    <dvportgroup nil="true"/>
    <enabled type="boolean">true</enabled>
    <fence_mode>bridged</fence_mode>
    <gateway>10.1.1.254</gateway>
    <id type="integer">13</id>
    <identifier>c2a5a42c-594f-47ba-b211-8e456f17b825</identifier>
    <ip_address_pool_id nil="true"/>
    <is_nated type="boolean">true</is_nated>
    <label>antonov routed net</label>
    <netmask>255.255.255.0</netmask>
    <network_group_id type="integer">7</network_group_id>
    <prefix_size nil="true"/>
    <primary_dns nil="true"/>
    <secondary_dns nil="true"/>
    <shared type="boolean">false</shared>
    <updated_at type="datetime">2016-02-13T10:35:21+02:00</updated_at>
    <user_id nil="true"/>
    <vapp_id type="integer">2</vapp_id>
    <vdc_id nil="true"/>
    <vlan nil="true"/>
  </vapp_network>
  ...
</vapp_networks>
```

Where:
- `created_at` - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format
- `default_nat_rule_number` - default NAT rule
- `default_outside_ip_address_id` - ID of the outside IP address
- `dns_suffix` - the DNS suffix
- `dvportgroup` - the portgroup that backs this network
- `enabled` - whether the network is enabled or not
- `fence_mode` - isolation type of the network
- `gateway` - the gateway associated with the network
- `id` - the ID of the network
- `identifier` - the identifier of the network
- `ip_address_pool_id` - ID of the IP Address Pool
- `is_nated` - set true to use NAT for translating the traffic. Set false if you are using your own firewall with external IP address
- `label` - the name of the network
- `netmask` - IP of the network mask
network_group_id - network zone ID
prefix_size - subnet prefix size
primary_dns - IP address of the primary domain name system (DNS) server
secondary_dns - IP address of the secondary domain name system (DNS) server
shared - whether this vApp network is shared or not
updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
user_id - owner ID
vapp_id - the vApp associated with the network
vdc_id - the resource pool associated with the network
vlan - VLAN number

3.16.2 Get vApp Network Details

To view the details of vApp network, use the following request:

GET /settings/vapp_networks/:id.xml
GET /settings/vapp_networks/:id.json

XML Request Example

curl -i -X GET -u 'user:userpass' --url

JSON Request Example

curl -i -X GET -u 'user:userpass' --url

XML Output Example
<vapp_network>
  <created_at type="datetime">2016-02-13T10:35:21+02:00</created_at>
  <default_nat_rule_number type="integer">9999</default_nat_rule_number>
  <default_outside_ip_address_id nil="true"/>
  <dns_suffix nil="true"/>
  <dvportgroup nil="true"/>
  <enabled type="boolean">true</enabled>
  <fence_mode>bridged</fence_mode>
  <gateway>10.1.1.254</gateway>
  <id type="integer">13</id>
  <identifier>2ca5a42c-594f-47ba-b211-8e456f17b825</identifier>
  <ip_address_pool_id nil="true"/>
  <is_nated type="boolean">true</is_nated>
  <label>antonov routed net</label>
  <netmask>255.255.255.0</netmask>
  <network_group_id type="integer">7</network_group_id>
  <prefix_size nil="true"/>
  <primary_dns nil="true"/>
  <secondary_dns nil="true"/>
  <shared type="boolean">false</shared>
  <updated_at type="datetime">2016-02-13T10:35:21+02:00</updated_at>
  <user_id nil="true"/>
  <vapp_id type="integer">2</vapp_id>
  <vdc_id nil="true"/>
  <vlan nil="true"/>
</vapp_network>

Where:
created_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
default_nat_rule_number - default NAT rule
default_outside_ip_address_id - ID of the outside IP address
dns_suffix - the DNS suffix
dvportgroup - the portgroup that backs this network
enabled - whether the network is enabled or not
fence_mode - isolation type of the network
gateway - the gateway associated with the network
id - the ID of the network
identifier - the identifier of the network
ip_address_pool_id - ID of the IP Address Pool
is_nated - set true to use NAT for translating the traffic. Set false if you are using your own firewall with external IP address
label - the name of the network
netmask - IP of the network mask
network_group_id - network zone ID
prefix_size - subnet prefix size
primary_dns - IP address of the primary domain name system (DNS) server
secondary_dns - IP address of the secondary domain name system (DNS) server
shared - whether this vApp network is shared or not
updated_at - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
user_id - owner ID
vapp_id - the vApp associated with the network
vdc_id - the resource pool associated with the network
vlan - VLAN number

3.16.3 Get List of IP Addresses Assigned to vApp Network

To get the list of IP addresses assigned to the vApp network, use the following request:

GET /settings/vapp_networks/:id/ip_addresses.xml
GET /settings/vapp_networks/:id/ip_addresses.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```
<ip_addresses type="array">
  <ip_address>
    <address>10.1.1.1</address>
    <broadcast nil="true"/>
    <created_at type="datetime">2016-02-13T10:35:21+02:00</created_at>
    <customer_network_id nil="true"/>
    <disallowed_primary type="boolean">false</disallowed_primary>
    <gateway>10.1.1.254</gateway>
    <hypervisor_id nil="true"/>
    <id type="integer">1901</id>
    <ip_address_pool_id nil="true"/>
    <network_address nil="true"/>
    <network_id type="integer">13</network_id>
    <pxe type="boolean">false</pxe>
    <updated_at type="datetime">2016-02-13T10:35:21+02:00</updated_at>
    <user_id nil="true"/>
    <free type="boolean">true</free>
    <netmask>255.255.255.0</netmask>
  </ip_address>
  ...
</ip_addresses>
```

**Where:**

- **address** - the IP address assigned to the vApp network
- **broadcast** - the broadcast address
- **created_at** - the date in the [YYYY][MM][DD][hh][mm][ss]Z format
- **customer_network_id** - the ID of the customer network
- **disallowed_primary** - true if not allowed to be used as primary (for VS build), otherwise false
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

**gateway** - the gateway associated with the network

**hypervisor_id** - the ID of the compute resource the IP address is associated with

**id** - the ID of the network

**ip_address_pool_id** - ID of the IP Address Pool

**network_address** - the address of the network

**network_id** - the ID of the network

**pxe** - true, if this compute resource address can be used for cloudbooting a compute resource

**updated_at** - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format

**user_id** - owner ID

**free** - true if free, otherwise false

**netmask** - IP of the network mask

### 3.17 vCloud Virtual Servers API

Virtual servers in OnApp are based on templates and deployed on compute resources. VMware Cloud Director virtual servers have their own root accounts so that VS owners can fully control, configure, and manage their servers.

This chapter includes API requests specific to VMware Cloud Director virtual servers. For more information on [Virtual Servers API](#), refer to the linked guide.

#### 3.17.1 Add Media File to vCloud VS

To add a media file to a virtual server, use the following request:

PUT /virtual_machines/:id/media_drive.xml

PUT /virtual_machines/:id/media_drive.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**Where:**

**media** - ID of the media file

#### 3.17.2 Remove Media File from vCloud VS

To remove media file from a virtual server, use the following request:

POST /virtual_machines/:id/media_drive/eject.xml

POST /virtual_machines/:id/media_drive/eject.json
XML Request Example

curl -i -X POST
http://onapp.test/virtual_machines/12/media_drive/eject.xml -u
user:userpass -H 'Accept: application/xml' -H 'Content-type: application/xml'

JSON Request Example

curl -i -X POST
http://onapp.test/virtual_machines/12/media_drive/eject.json -u
user:userpass -H 'Accept: application/json' -H 'Content-type: application/json'

3.17.3 View vCloud VS Guest Customization

To view VS guest customization, use the following request:

GET /virtual_machines/:id/guest_customization.xml
GET /virtual_machines/:id/guest_customization.json

XML Request Example

curl -i -X GET -u user:userpass --url

JSON Request Example

curl -i -X GET -u user:userpass --url
http://onapp.test/virtual_machines/20/guest_customization.json -H
'Accept: application/json' -H 'Content-type: application/json'

XML Output Example
<vcloud_guest_customization>
  <admin_auto_logon_count type="integer">0</admin_auto_logon_count>
  <admin_auto_logon_enabled type="boolean">false</admin_auto_logon_enabled>
  <admin_password_auto type="boolean">true</admin_password_auto>
  <admin_password_enabled type="boolean">false</admin_password_enabled>
  <change_sid type="boolean">false</change_sid>
  <computer_name>Centos66-001</computer_name>
  <created_at type="datetime">2016-02-06T16:53:52+02:00</created_at>
  <domain_name nil="true"/>
  <domain_user_name nil="true"/>
  <domain_user_password nil="true"/>
  <enabled type="boolean">true</enabled>
  <id type="integer">20</id>
  <join_domain_enabled type="boolean">false</join_domain_enabled>
  <machine_object_ou nil="true"/>
  <reset_password_required type="boolean">false</reset_password_required>
  <script nil="true"/>
  <updated_at type="datetime">2016-02-06T16:53:52+02:00</updated_at>
  <use_org_settings type="boolean">false</use_org_settings>
  <virtual_machine_id type="integer">20</virtual_machine_id>
</vcloud_guest_customization>

Where:

admin_auto_logon_count - the number of times administrator can log in automatically
admin_auto_logon_enabled - true if administrator can log in automatically; otherwise false
admin_password_auto - true if admin password is generated automatically; otherwise false
admin_password_enabled - true if admin password is required; otherwise false
change_sid - this parameter is applicable for Windows VSs only and will run Sysprep to change Windows SID. On Windows NT, VCD uses Sidgen. Running sysprep is a prerequisite for completing domain join
computer_name - VS's computer name
created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
enabled - true if guest customization is enabled in VMware Cloud Director; otherwise false
id - ID of the VS guest customization
join_domain_enabled - true if the VS is enabled to join a domain; otherwise false
reset_password_required - true if a password reset is required; otherwise false
updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
use_org_settings - true if user org settings are enabled; otherwise false
virtual_machine_id - ID of the VS, which guest customization is viewed

3.17.4 Edit Virtual Server Disks

To edit a VMware Cloud Director virtual server disk, use the following request:

PUT /settings/disks/:id.xml
PUT /settings/disks/:id.json

You also can edit a virtual server disk, using the following URL:

/virtual_machines/:virtual_machines_id/disks/:id
XML Request Example

curl -i -X PUT http://onapp.test/settings/disks/12.xml -d
  '<disk><label>BU</label><disk_size>1</disk_size><data_store_id>33</data_store_id><hot_migrate_disk>1</hot_migrate_disk></disk>' -u user:userpass -H
  'Accept: application/xml' -H 'Content-type: application/xml'

JSON Request Example

curl -i -X PUT http://onapp.test/settings/disks/12.json -d
  '{"disk":{"label":"BU", "disk_size":"1", "data_store_id":"33", "hot_migrate_disk":"1"}}' -u user:userpass -H 'Accept: application/json' -H
  'Content-type: application/json'

Where:

- **label** - the label of the disk
- **disk_size** - the disk space in GB
- **data_store_id** - the ID of a data store you want to migrate the disk to
- **hot_migrate_disk** - set to 1 to migrate the disk in the hot (live) mode, otherwise, set to 0

- You cannot decrease the size of the disk.
- If fast provisioning is enabled for the disk resource pool, the disk cannot be resized.
- If you resize the disk of a VS that is powered on, the virtual server will be rebooted.
- If you migrate the disk without the hot_migrate_disk option enabled, the virtual server will be rebooted.
- You can only migrate disks to data stores in data store zones assigned to your bucket.
- You cannot migrate a disk to a data store with less capacity than the disk size.

3.17.5 Set SSH Keys

To assign specific SSH keys from all available owner and user keys to a virtual server, use the following request:

```
PUT /virtual_machines/:virtual_machine_id/set_ssh_keys.json
```

JSON Request Example

Where:

*ssh_key* - is public SSH key

### 3.17.6 Resync vCloud VS

To resync a vCloud virtual server into OnApp, use the following request:

```
POST /virtual_machines/:id/resync.xml
POST /virtual_machines/:id/resync.json
```

**XML Request Example**

```
```

**JSON Request Example**

```
curl -X POST -u 'user:userpass' --url http://onapp.test/virtual_machines/vm-0a81025d-877b-4b34-9c4c-7bbf8d436e1d/resync.json -H 'Accept: application/json' -H 'Content-Type: application/json'
```

**XML Output Example**
<virtual_machine>
  <id type="integer">26</id>
  <hypervisor_id type="integer">7</hypervisor_id>
  <template_id nil="true"/>
  <identifier>vm-0a81025d-877b-4b34-9c4c-7bbf8d436e1d</identifier>
  <hostname>msartemname</hostname>
  <memory type="integer">1024</memory>
  <cpus type="integer">1</cpus>
  <cpu_shares type="integer">1</cpu_shares>
  <created_at type="dateTime">2021-10-20T10:02:36+03:00</created_at>
  <updated_at type="dateTime">2021-10-21T10:30:31+03:00</updated_at>
  <built type="boolean">true</built>
  <locked type="boolean">false</locked>
  <booted type="boolean">true</booted>
  <xen_id nil="true"/>
  <remote_access_password nil="true"/>
  <local_remote_access_port nil="true"/>
  <label>msartem_resync_vm</label>
  <recovery_mode nil="true"/>
  <user_id type="integer">23</user_id>
  <operating_system>linux</operating_system>
  <operating_system_distro>centos64Guest</operating_system_distro>
  <allowed_swap type="boolean">true</allowed_swap>
  <template_label nil="true"/>
  <min_disk_size nil="true"/>
  <allowed_hot_migrate nil="true"/>
  <note nil="true"/>
  <admin_note nil="true"/>
  <suspended type="boolean">false</suspended>
  <strict_virtual_machine_id nil="true"/>
  <enable_autoscale type="boolean">false</enable_autoscale>
  <add_to_marketplace nil="true"/>
  <state>delivered</state>
  <initial_root_password_encrypted type="boolean">false</initial_root_password_encrypted>
  <storage_server_type nil="true"/>
  <firewall_notrack type="boolean">false</firewall_notrack>
  <service_password nil="true"/>
  <preferred_hvs type="array"/>
  <local_remote_access_ip_address nil="true"/>
  <cpu_units type="integer">10</cpu_units>
  <cpu_socket nil="true"/>
  <draas_keys type="array"/>
  <iso_id nil="true"/>
  <cores_per_socket_type="integer">1</cores_per_socket>
  <instance_package_id nil="true"/>
  <hot_add_cpu type="boolean">false</hot_add_cpu>
  <hot_add_memory type="boolean">false</hot_add_memory>
  <time_zone nil="true"/>
  <autoscale_service nil="true"/>
  <cdboot type="boolean">false</cdboot>
  <draas_mode type="integer">0</draas_mode>
  <vapp_id type="integer">32</vapp_id>
  <vmware_tools type="integer">10240</vmware_tools>
  <vcenter_moref>vm-4228</vcenter_moref>
  <template_version nil="true"/>
  <openstack_id nil="true"/>
  <domain>localdomain</domain>
  <vcenter_reserved_memory nil="integer">0</vcenter_reserved_memory>
  <deleted_at nil="true"/>
  <properties/>
  <acceleration_allowed type="boolean">true</acceleration_allowed>
  <vcenter_cluster_id nil="true"/>
  <virsh_console type="boolean">false</virsh_console>
As a result of this API call, the `ReimportVCloudVirtualMachine` transaction will be scheduled on Control Panel. After this transaction is completed, disks, NICs, CPU, and RAM of the current VS will be updated.

### 3.18 vCloud VS Snapshots API

Snapshots lock the filesystem disk and create a new disk with the changes made alongside. There can be only one snapshot per VS: when a new snapshot is created for the VS, the previous one is deleted. This section lists the API calls you can use to manage snapshots.
3.18.1 Get List of vCloud VS Snapshots

To view the list of snapshots, use the following request:

GET /virtual_machines/:id/snapshots.xml
GET /virtual_machines/:id/snapshots.json

**XML Request Example**

```
curl -i -X GET -u user:userpass --url http://onapp.test/virtual_machines/3/snapshots.xml
```

**JSON Request Example**

```
curl -i -X GET -u user:userpass --url http://onapp.test/virtual_machines/3/snapshots.xml
```

**Where:**

- **id** - ID of the VS the snapshot is associated with

**XML Output Example**

```
<virtual_machine_snapshots type="array">
  <virtual_machine_snapshot>
    <created_at type="datetime">2015-03-31T15:46:00+00:00</created_at>
    <id type="integer">1</id>
    <is_built type="boolean">false</is_built>
    <name>New Snapshot</name>
    <updated_at type="datetime">2015-03-31T15:46:00+00:00</updated_at>
    <virtual_machine_id type="integer">3</virtual_machine_id>
  </virtual_machine_snapshot>
</virtual_machine_snapshots>
```

**Where:**

- **created_at** - the date when the record in the database was created
- **id** - the ID of this snapshot
- **is_built** - whether the snapshot was created or not
- **name** - the label of the snapshot
- **updated_at** - the date when this record in database was updated
- **virtual_machine_id** - ID of the VS for which the snapshot was made

3.18.2 Create vCloud VS Snapshot

To create a snapshot, use the following request:

POST /virtual_machines/:id/snapshots.xml
POST /virtual_machines/:id/snapshots.json

**XML Request Example**

```
curl -i -X POST -u user:userpass --url http://onapp.test/virtual_machines/3/snapshots.xml
```

**JSON Request Example**

```bash
```

Where:
- **memory** - the amount of RAM allocated to this VS in Mb
- **quiesce** - set 1 to quiesce the file system in the VS, otherwise set 0

### 3.18.3 Build vCloud VS Snapshot

If the VS snapshot failed to build due to some reason, you can attempt to build it again. To build a VS snapshot, use the following request:

GET /virtual_machines/:vm_id/snapshots/:snapshot_id/build.xml

GET /virtual_machines/:vm_id/snapshots/:snapshot_id/build.json

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```

### 3.18.4 Restore vCloud VS Snapshot

To restore a VS snapshot, use the following request:

GET /virtual_machines/:virtual_machine_id/snapshots/:id/restore.xml

GET /virtual_machines/:virtual_machine_id/snapshots/:id/restore.json

**XML Request Example**

```bash
curl -i -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml' http://onapp.test/virtual_machines/12/snapshots/2/restore.xml
```

**JSON Request Example**

```bash
curl -i -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json' http://onapp.test/virtual_machines/12/snapshots/2/restore.json
```
3.18.5 Delete vCloud VS Snapshot

To delete a snapshot, use the following request:

DELETE /virtual_machines/:virtual_machine_id/snapshots/:id.xml
DELETE /virtual_machines/:virtual_machine_id/snapshots/:id.json

XML Request Example

curl -i -X DELETE -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml'
http://onapp.test/virtual_machines/12/snapshots/2.xml

JSON Request Example

curl -i -X DELETE -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json'
http://onapp.test/virtual_machines/12/snapshots/2.json

3.19 System Configuration API

API calls related to the configuration settings of your VMware Cloud Director installation.

3.19.1 View System Configuration

This document provides information on VCD-related system configuration settings. For information on general OnApp system settings, refer to the OnApp Cloud API Guide.

To view system configuration settings, use the following request:

GET /settings/configuration.xml
GET /settings/configuration.json

XML Request Example

curl -i -X GET -u user:userpass --url
-A 'Accept: application/xml' -H 'Content-type: application/xml'
http://onapp.test/settings/configuration.xml

JSON Request Example

XML Output Example

```
<settings>
  <rabbitmq_host>127.0.0.1</rabbitmq_host>
  <rabbitmq_port type="integer">5672</rabbitmq_port>
  <rabbitmq_vhost type="string"></rabbitmq_vhost>
  <rabbitmq_login type="string"></rabbitmq_login>
  <rabbitmq_password type="string"></rabbitmq_password>
  <default_timeout type="integer">120</default_timeout>
  <delete_vapp_template_timeout type="integer">120</delete_vapp_template_timeout>
  <delete_vapp_timeout type="integer">120</delete_vapp_timeout>
  <delete_media_timeout type="integer">120</delete_media_timeout>
  <instantiate_vapp_template_timeout type="integer">900</instantiate_vapp_template_timeout>
  <power_on_timeout type="integer">600</power_on_timeout>
  <power_off_timeout type="integer">600</power_off_timeout>
  <suspend_timeout type="integer">600</suspend_timeout>
  <discard_suspend_timeout type="integer">600</discard_suspend_timeout>
  <reboot_timeout type="integer">600</reboot_timeout>
  <undeploy_timeout type="integer">720</undeploy_timeout>
  <process_descriptor_vapp_template_timeout type="integer">300</process_descriptor_vapp_template_timeout>
  <http_request_timeout type="integer">240</http_request_timeout>
  <recompose_vapp_timeout type="integer">200</recompose_vapp_timeout>
  <create_edge_gateway_timeout type="integer">600</create_edge_gateway_timeout>
  <compose_vapp_template_timeout type="integer">300</compose_vapp_template_timeout>
  <create_snapshot_timeout type="integer">3600</create_snapshot_timeout>
  <create_vdc_timeout type="integer">300</create_vdc_timeout>
  <max_cpu_quota type="integer">0</max_cpu_quota>
  <max_memory_quota type="integer">0</max_memory_quota>
</settings>
```

Where:

- `rabbitmq_host` - the RabbitMQ server IP address
- `rabbitmq_port` - the RabbitMQ port
- `rabbitmq_vhost` - the name of the "virtual host" (vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.
- `rabbitmq_login` - the login of a RabbitMQ instance
- `rabbitmq_password` - the password of a RabbitMQ instance
- `default_timeout` - the default timeout for running VCD-related operations that are not listed below
- `delete_vapp_template_timeout` - the amount of time for deleting a vApp template
- `delete_vapp_timeout` - the amount of time for deleting a vApp
- `delete_media_timeout` - the amount of time for deleting media files
- `instantiate_vapp_template_timeout` - the amount of time for provisioning a vApp
- `power_on_timeout` - the amount of time for starting up a powered-off virtual server

416
power_off_timeout - the amount of time for shutting down a powered-on virtual server
suspend_timeout - the amount of time for suspending a virtual server
discard_suspend_timeout - the amount of time for unsuspending a virtual server
reboot_timeout - the amount of time for rebooting a virtual server
undeploy_timeout - the amount of time for undeploying a vApp. The undeployment is taking place for a vApp that includes no virtual servers but has assigned networks.
process_descriptor_vapp_template_timeout - the amount of time for uploading a vApp template
http_request_timeout - the amount of time for executing HTTP (API) requests
recompose_vapp_timeout - the amount of time for recomposing vApp
create_edge_gateway_timeout - the amount of time for creating an edge gateway
compose_vapp_template_timeout - the amount of time for composing a vApp template
create_snapshot_timeout - the amount of time for creating a VS snapshot
create_vdc_timeout - the amount of time for creating a resource pool
max_cpu_quota - the custom max CPU quota limit available
max_memory_quota - the custom max memory limit available

3.19.2 Edit System Configuration

This document provides information on VCD-related system configuration settings. For information on general OnApp system settings, refer to the OnApp Cloud API Guide.

To edit VCD-related configuration settings, use the following requests:
PUT /settings.xml
PUT /settings.json

XML Request Example
  <rabbitmq_host>127.0.0.1</rabbitmq_host>
  <rabbitmq_port type="integer">5672</rabbitmq_port>
  <rabbitmq_vhost>/<rabbitmq_vhost>
  <rabbitmq_login>login</rabbitmq_login>
  <rabbitmq_password>password</rabbitmq_password>
  <default_timeout type="integer">120</default_timeout>
  <delete_vapp_template_timeout type="integer">120</delete_vapp_template_timeout>
  <delete_vapp_timeout type="integer">120</delete_vapp_timeout>
  <delete_media_timeout type="integer">120</delete_media_timeout>
  <instantiate_vapp_template_timeout type="integer">900</instantiate_vapp_template_timeout>
  <power_on_timeout type="integer">600</power_on_timeout>
  <power_off_timeout type="integer">600</power_off_timeout>
  <suspend_timeout type="integer">600</suspend_timeout>
  <discard_suspend_timeout type="integer">600</discard_suspend_timeout>
  <reboot_timeout type="integer">600</reboot_timeout>
  <undeploy_timeout type="integer">720</undeploy_timeout>
  <process_descriptor_vapp_template_timeout type="integer">300</process_descriptor_vapp_template_timeout>
  <http_request_timeout type="integer">240</http_request_timeout>
  <recompose_vapp_timeout type="integer">200</recompose_vapp_timeout>
  <create_edge_gateway_timeout type="integer">600</create_edge_gateway_timeout>
  <create_vdc_timeout type="integer">300</create_vdc_timeout>
  <max_cpu_quota type="integer">0</max_cpu_quota>
  <max_memory_quota type="integer">0</max_memory_quota>
</configuration>'

JSON Request Example
  "configuration": {
    "rabbitmq_host": "127.0.0.1",
    "rabbitmq_port": 5672,
    "rabbitmq_vhost": "/",
    "rabbitmq_login": "login",
    "rabbitmq_password": "password",
    "default_timeout": 120,
    "delete_vapp_template_timeout": 120,
    "delete_vapp_timeout": 120,
    "delete_media_timeout": 120,
    "instantiate_vapp_template_timeout": 900,
    "power_on_timeout": 600,
    "power_off_timeout": 600,
    "suspend_timeout": 600,
    "discard_suspend_timeout": 600,
    "reboot_timeout": 600,
    "undeploy_timeout": 720,
    "process_descriptor_vapp_template_timeout": 300,
    "http_request_timeout": 240,
    "recompose_vapp_timeout": 200,
    "create_edge_gateway_timeout": 600,
    "compose_vapp_template_timeout": 300,
    "create_snapshot_timeout": 3600,
    "create_vdc_timeout": 300,
    "max_cpu_quota type": 0,
    "max_memory_quota": 0
  }
}'

Where:

**rabbitmq_host** - the RabbitMQ server IP address

**rabbitmq_port** - the RabbitMQ port

**rabbitmq_vhost** - the name of the "virtual host" (or vhost) that specifies the namespace for entities (exchanges and queues) referred to by the protocol. Note that this is not virtual hosting in the HTTP sense.

**rabbitmq_login** - the login of a RabbitMQ instance

**rabbitmq_password** - the password of a RabbitMQ instance

**default_timeout** - the default timeout for running VCD-related operations that are not listed below

**delete_vapp_template_timeout** - the amount of time for deleting a vApp template

**delete_vapp_timeout** - the amount of time for deleting vApp

**delete_media_timeout** - the amount of time for deleting media files

**instantiate_vapp_template_timeout** - the amount of time for provisioning vApp

**power_on_timeout** - the amount of time for starting up a powered-off virtual server

**power_off_timeout** - the amount of time for shutting down a powered-on virtual server

**suspend_timeout** - the amount of time for suspending a virtual server

**discard_suspend_timeout** - the amount of time for unsuspending a virtual server

**reboot_timeout** - the amount of time for rebooting a virtual server

**undeploy_timeout** - the amount of time for undeploying a vApp. The undeployment is taking place for a vApp that includes no virtual servers but has assigned networks.
process_descriptor_vapp_template_timeout - the amount of time for uploading a vApp template
http_request_timeout - the amount of time for executing HTTP (API) requests
recompose_vapp_timeout - the amount of time for recomposing vApp
create_edge_gateway_timeout - the amount of time for creating an edge gateway
compose_vapp_template_timeout - the amount of time for composing a vApp template
create_vdc_timeout - the amount of time for creating a resource pool
max_cpu_quota - the custom max CPU quota limit available. The default value is 1000GHz.
max_memory_quota - the custom max memory limit available. The default value is 1000GB.

3.20 NSX-V Integration API

This section provides the API calls you can use to manage NSX-V items imported from vCloud.

3.20.1 NSX-V Certificates API

Service certificates are required in case you select Certificate authentication option while configuring an IPSec VPN site for your vCloud edge gateway. This section contains the API requests you can use to manage NSX-V certificates and CRL certificates.

3.20.1.1 Get List of NSX Certificates

To get the list of NSX-V certificates imported from vCloud, use the following request:

GET /nsx/edges/:edge_id/certificates.xml
GET /nsx/edges/:edge_id/certificates.json

XML Request Example

JSON Request Example

XML Output Example
<nsx_certificates type="array">
  <nsx_certificate>
    <id type="integer">10</id>
    <identifier>certificate-54</identifier>
    <label>adfs.onappdev.lviv</label>
    <common_name>adfs.onappdev.lviv</common_name>
    <issuer_common_name>adfs.onappdev.lviv</issuer_common_name>
    <certificate_type>certificate_self_signed</certificate_type>
    <edge_id type="integer">3</edge_id>
    <valid_from type="dateTime">2018-05-07T08:08:43Z</valid_from>
    <not_after type="dateTime">2023-05-06T08:08:43Z</not_after>
    <created_at type="dateTime">2019-11-11T08:26:41Z</created_at>
    <updated_at type="dateTime">2019-11-11T08:26:41Z</updated_at>
    <signature_algorithm>SHA256WITHRSA</signature_algorithm>
    <public_key_algorithm>RSA</public_key_algorithm>
    <public_key_length type="integer">2048</public_key_length>
  </nsx_certificate>
  <nsx_certificate>
    <id type="integer">13</id>
    <identifier>certificate-51</identifier>
    <label>GlobalSign Domain Validation CA - SHA256 - G2</label>
    <common_name>GlobalSign Domain Validation CA - SHA256 - G2</common_name>
    <issuer_common_name>GlobalSign Root CA</issuer_common_name>
    <certificate_type>certificate_ca</certificate_type>
    <edge_id type="integer">3</edge_id>
    <valid_from type="dateTime">2014-02-20T10:00:00Z</valid_from>
    <not_after type="dateTime">2019-02-20T10:00:00Z</not_after>
    <created_at type="dateTime">2019-11-11T08:26:41Z</created_at>
    <updated_at type="dateTime">2019-11-11T08:26:41Z</updated_at>
    <signature_algorithm>SHA256WITHRSA</signature_algorithm>
    <public_key_algorithm>RSA</public_key_algorithm>
    <public_key_length type="integer">2048</public_key_length>
  </nsx_certificate>
</nsx_certificates>

Where:

id - the ID number of the certificate
identifier - the identifier of the certificate
label - the label of the certificate
common_name - the certificate's common name
issuer_common_name - common name of the certificate's issuer
certificate_type - certificate_ca, certificate_self_signed, or certificate_signed
edge_id - the ID of the edge the certificate is assigned to
valid_from - the date when the certificate started to be valid
not_after - final end-date, until the certificate is valid
created_at - the date when the certificate was created in the [YYYY][MM][DD]T[hh][mm][ss]Z format
updated_at - the date when the certificate was updated in the [YYYY][MM][DD]T[hh][mm][ss]Z format
signature_algorithm - the certificate's signature algorithm
public_key_algorithm - RSA or DSA
public_key_length - the key size in bits. The minimum is 2048 bits
3.20.1.2 Get List of CRL Certificates
To get the list of CRL certificates, use the following request:

GET /nsx/edges/:edge_id/crls.xml
GET /nsx/edges/:edge_id/crls.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example

```
<nsx_crls type="array">
  <nsx_crl>
    <id type="integer">3</id>
    <label>serviceexample.test</label>
    <identifier>crl-6</identifier>
    <issuer_common_name>serviceexample.test</issuer_common_name>
    <edge_id type="integer">3</edge_id>
    <next_update type="dateTime">2019-11-24T12:57:04Z</next_update>
    <created_at type="dateTime">2019-11-11T08:26:41Z</created_at>
    <updated_at type="dateTime">2019-11-11T08:26:41Z</updated_at>
  </nsx_crl>
  <nsx_crl>
    <id type="integer">4</id>
    <label>www.example.com</label>
    <identifier>crl-5</identifier>
    <issuer_common_name>www.example.com</issuer_common_name>
    <edge_id type="integer">3</edge_id>
    <next_update type="dateTime">2019-11-15T11:15:49Z</next_update>
    <created_at type="dateTime">2019-11-11T08:26:41Z</created_at>
    <updated_at type="dateTime">2019-11-11T08:26:41Z</updated_at>
  </nsx_crl>
  <nsx_crl>
    <id type="integer">5</id>
    <label>www.example.com</label>
    <identifier>crl-4</identifier>
    <issuer_common_name>www.example.com</issuer_common_name>
    <edge_id type="integer">3</edge_id>
    <next_update type="dateTime">2019-11-15T11:15:49Z</next_update>
    <created_at type="dateTime">2019-11-11T08:26:41Z</created_at>
    <updated_at type="dateTime">2019-11-11T08:26:41Z</updated_at>
  </nsx_crl>
</nsx_crls>
```

Where:

- **id** - ID of the CRL certificate
- **label** - label of the CRL certificate
- **identifier** - identifier of the CRL certificate
issuer_common_name - common name of the issuer
edge_id - ID of the corresponding edge
next_update - date of the next update scheduled in the [YYYY][MM][DD][hh][mm][ss]Z format
created_at - the date when the CRL certificate was created in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date when the CRL certificate was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

3.20.2 NSX-V Edge Gateways API
This section provides the API calls you can use to manage NSX-V edge gateways imported from VMware Cloud Director.

- Get List of NSX-V Edge Gateways
- Get List of NSX-V Edge Gateway Interfaces
- Get NSX-V Edge Gateway Details
- Create NSX-V Edge Gateway
- Edit NSX-V Edge Gateway
- Edit External Networks
- Delete NSX-V Edge Gateway
- Convert Edge Gateways to Advanced Edge Gateways

3.20.2.1 Get List of NSX-V Edge Gateways
To view the list of NSX-V edge gateways, use the following request:

GET /edge_gateways.xml
GET /edge_gateways.json

**XML Request Example**

```
curl -i -X GET http://onapp.test/edge_gateways.xml -u user:userpass
```

**JSON Request Example**

```
curl -i -X GET http://onapp.test/edge_gateways.json -u user:userpass
```

**XML Output Example**
Where:

- **advanced_enabled** - true, if the edge gateway is advanced, otherwise false
- **created_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- **description** - the description of the edge gateway by the admin
gateway_backing_config - the configuration of the edge gateway, can be: compact, full, full-4
ha_enabled - whether high availability option is enabled for this edge gateway or not
id - ID of the edge gateway
identifier - the identifier of the edge gateway
label - the name of the edge gateway
status - edge gateway status
updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
use_default_route_for_dns_relay - whether default route for dns relay is used or not
vdc_id - ID of the vDC the edge gateway is associated with
firewall_service - equal to nil if firewall service is imported into CP
gateway_ipsec_vpn_service - an array of parameters related to the VPN service of the edge gateway
nat_service - equal to nil if is the NAT service of the edge gateway is imported into CP
nsx_edge - an array of parameters related to the NSX edge:
  id - ID of the NSX edge
  label - the name of the NSX edge
  identifier - the identifier of the NSX edge
  manager_id - ID of NSX manager
  state - indicates if the NSX edge is deployed
  status - indicates the status of the NSX edge
  created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
  updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
edge_gateway - an array of parameters related to the edge gateway:
  advanced_enabled - true, if the edge gateway is advanced, otherwise false
  created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
  description - the description of the edge gateway by the admin
gateway_backing_config - the configuration of the edge gateway, can be: compact, full, full-4
ha_enabled - whether high availability option is enabled for this edge gateway or not
id - ID of the edge gateway
identifier - the identifier of the edge gateway
label - the name of the edge gateway
status - edge gateway status
updated_at - the date in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
use_default_route_for_dns_relay - whether default route for dns relay is used or not
vdc_id - ID of the VDC the edge gateway is associated with
firewall_service - equal to nil if firewall service is imported into CP
gateway_ipsec_vpn_service - equal to nil if the VPN service of the edge gateway is enabled
nat_service - equal to nil if is the NAT service of the edge gateway is imported into CP
v. 6.4
- added `nsx_edge` parameter together with the subsequent parameters 
  (id, label, identifier, manager_id, state, status, created_at, updated_at)
- added `edge_gateway` parameter together with the subsequent parameters 
  (advanced_enabled, created_at, description, gateway_backing_config, ha_enabled, id, identifier, label, status, updated_at, use_default_route_for_dns_relay, vdc_id, firewall_service, gateway_ipsec_vpn_service, nat_service)

v. 5.4
- added `advanced_enabled` parameter

3.20.2.2 Get List of NSX-V Edge Gateway Interfaces
To view the list of NSX-V edge gateway interfaces, use the following request:
GET /edge_gateways/:id/gateway_interfaces.xml
GET /edge_gateways/:id/gateway_interfaces.json

XML Request Example
```
curl -i -X GET -u user:userpass -H 'Accept: application/xml' -H 'Content-Type: application/xml'
http://onapp.test/edge_gateways/5/gateway_interfaces.xml
```

JSON Request Example
```
curl -i -X GET -u user:userpass -H 'Accept: application/json' -H 'Content-Type: application/json'
http://onapp.test/edge_gateways/5/gateway_interfaces.json
```

XML Output Example
```
<gateway_interfaces type="array">
  <gateway_interface>
    <created_at type="datetime">2016-05-25T02:36:24+03:00</created_at>
    <default_firewall_rule>ACCEPT</default_firewall_rule>
    <id type="integer">1628</id>
    <identifier>axd19u2wrhjllv</identifier>
    <label>Fake Ext Net DC1</label>
    <network_join_id type="integer">624</network_join_id>
    <updated_at type="datetime">2016-05-25T02:36:24+03:00</updated_at>
  </gateway_interface>
  <gateway_interface>
    <created_at type="datetime">2016-05-25T02:36:24+03:00</created_at>
    <default_firewall_rule>ACCEPT</default_firewall_rule>
    <id type="integer">1629</id>
    <identifier>i88bsaopdhsoqz</identifier>
    <label>onapp routed net 2</label>
    <network_join_id type="integer">634</network_join_id>
    <updated_at type="datetime">2016-05-25T02:36:24+03:00</updated_at>
  </gateway_interface>
</gateway_interfaces>
```

Where:
`created_at` - the date when the edge gateway interface was created in the [YYYY][MM][DD][hh][mm][ss]Z format
default_firewall_rule - set default firewall rule for the edge gateway interface – either DROP or ACCEPT

id - ID of the edge gateway interface

identifier - the identifier of the edge gateway interface

label - the name of the edge gateway interface

network_join_id - the ID of the network join to which this edge gateway interface belongs

updated_at - the date when the edge gateway interface was updated in the [YYYY][MM][DD][T][hh][mm][ss]Z format

3.20.2.3 Get NSX-V Edge Gateway Details
To view the details of NSX-V edge gateway, use the following request:

GET /edge_gateways/:id.xml

GET /edge_gateways/:id.json

XML Request example

```
curl -i -X GET http://onapp.test/edge_gateways/22.xml -u user:userpass
```

JSON Request Example

```
curl -i -X GET http://onapp.test/edge_gateways/22.json -u user:userpass
```

XML Output Example
<edge_gateways type="array">
  <edge_gateway>
    <advanced_enabled type="boolean">true</advanced_enabled>

- **label** - the name of the edge gateway
- **status** - edge gateway status
- **updated_at** - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format
- **use_default_route_for_dns Relay** - whether default route for DNS relay is used or not
- **vdc_id** - ID of the vDC the edge gateway is associated with
- **firewall_service** - equal to nil if firewall service is imported into CP
- **gateway_ipsec vpn service** - equal to nil if VPN service of the edge gateway is enabled
- **nat_service** - equal to nil if the NAT service of the edge gateway is enabled
- **nsx_edge** - an array of parameters related to the NSX edge:
  - **id** - ID of the NSX edge
  - **label** - the name of the NSX edge
  - **identifier** - the identifier of the NSX edge
  - **manager_id** - ID of NSX manager
  - **state** - indicates if the NSX edge is deployed
  - **status** - indicates the status of the NSX edge
  - **created_at** - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format
  - **updated_at** - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format
- **edge_gateway** - an array of parameters related to the edge gateway:
  - **advanced_enabled** - true, if the edge gateway is advanced, otherwise false
  - **created_at** - the date in the [YYYY][MM][DD]T[hh][mm][ss]Z format
  - **description** - the description of the edge gateway by the admin
  - **gateway_backing_config** - the configuration of the edge gateway, can be: compact, full, full-4
  - **ha_enabled** - whether high availability option is enabled for this edge gateway or not
  - **id** - ID of the edge gateway
  - **identifier** - the identifier of the edge gateway
**label** - the name of the edge gateway

**status** - edge gateway status

**updated_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

**use_default_route_for_dns_relay** - whether default route for DNS relay is used or not

**vdc_id** - ID of the VDC the edge gateway is associated with

**firewall_service** - equal to nil if firewall service is imported into CP

**gateway_ipsec_vpn_service** - equal to nil if the VPN service of the edge gateway is enabled

**nat_service** - equal to nil if is the NAT service of the edge gateway is imported into CP

**rate_limits** - an array of parameters related to the rate limits; equal to *null* when rate limits are not defined

**incoming** - the inbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mbps

**outgoing** - outbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mb/s

**sub_allocated_ip_ranges** - an array of parameters related to sub-allocated IPs

**start_address** - start IP address of the sub-allocated IPs range

**end_address** - end IP address of the sub-allocated IPs range

**Page History**

v.6.6 Edge 2

- added **rate_limits** parameter together with the subsequent parameters, **incoming** and **outgoing**

v.6.5 Edge 6

- added **sub_allocated_ip_ranges** parameter together with the subsequent parameters, **start_address** and **end_address**

v.6.4

- added added **nsx_edge** parameter together with the subsequent parameters
  (id, label, identifier, manager_id, state, status, created_at, updated_at)

- added **edge_gateway** parameter together with the subsequent parameters
  (advanced_enabled, created_at, description, gateway_backing_config, ha_enabled, id, identifier, label, status, updated_at, use_default_route_for_dns_relay, vdc_id, firewall_service, gateway_ipsec_vpn_service, nat_service)

v.5.4

- added **advanced_enabled** parameter

3.20.2.4 Create NSX-V Edge Gateway

To create an edge gateway, use the following request:

`POST /edge_gateways.xml`

`POST /edge_gateways.json`

**XML Request Example**
curl -i -X POST -u user:userpass --url http://onapp.test/edge_gateways.xml
-H 'Accept: application/xml' -H 'Content-type: application/xml' -d

JSON Request Example

curl -i -X POST -u user:userpass --url
http://onapp.test/edge_gateways.json
-H 'Accept: application/json' -H
'Content-type: application/json' -d '{"edge_gateway": {
"label": "Edge Gateway",
"description": "",
"vdc_id": "3",
"gateway_backing_config": "compact",
"ha_enabled": "true",
"advanced_enabled": "true",
"distributed_routing_enabled": "true",
"external_network_configurations_attributes": {
"0": {
"network_id": "2",
"ip_net_configurations_attributes": {
"0": {
"ip_net_id": "1",
"participate": "true",
"auto_ip_assignment": "true"}},
"1": {
"network_id": "3",
"ip_net_configurations_attributes": {
"0": {
"ip_net_id": "2",
"participate": "true",
"auto_ip_assignment": "true"}},
"1": {
"ip_net_id": "4",
"participate": "false",
"ip_range_id": "1872",
"ip_address": "10.0.0.3"}}},
"enable_rate_limits": "1",
"incoming_rate_limit": "101",
"outgoing_rate_limit": "102"}},
"configure_gateway": "true",
"default_gateway": "10.0.0.1",
"use_default_route_for_dns_relay": "true"}'}

Where:

- **label** - the name of the edge gateway
- **description** - the description of the edge gateway by the admin
- **vdc_id** - ID of the VDC the edge gateway is associated with
- **gateway_backing_config** - the configuration of the edge gateway, can be: compact, full, full-4
- **ha_enabled** - whether high availability option is enabled for this edge gateway or not
- **advanced_enabled** - true if advanced edge gateway services are enabled; otherwise, false
- **distributed_routing_enabled** - true if distributed routing is enabled; otherwise, false
external_network_configuration_attributes - an array of external network configuration attributes with the details:

- **network_id** - the ID of the external network which will be connected to the edge gateway
- **ip_net_configurations_attributes** - the array of attributes of the IP net as follows:
  - **ip_net_id** - the ID of the IP net
  - **participate** - true if the IP address is assigned for each of the subnets; otherwise, false
  - **auto_ip_assignment** - true if you want to configure the IP address manually; otherwise, false
  - **ip_range_id** - the ID of the IP range with available IP addresses
  - **ip_address** - the IP address of the IP net
- **enable_rate_limits** - set 1 to enable rate limits
- **incoming_rate_limit** - the inbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mb/s.
- **outgoing_rate_limit** - the outbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mb/s.

configure_gateway - true if the automatic configuration of the default gateway is enabled; otherwise, false

default_gateway - the default gateway

use_default_route_for_dns_relay - true if the default route for DNS relay is used; otherwise, false

Page History

v.6.1 Edge 2
- added the ip_range_id parameter

v.6.0
- added the following parameters:
  - advanced_enabled
  - distributed_routing_enabled
  - network_id
  - ip_net_id
  - participate
  - auto_ip_assignment
  - ip_address
  - enable_rate_limits
  - incoming_rate_limit
  - outgoing_rate_limit
  - configure_gateway
  - default_gateway
- removed the external_network_ids parameter
3.20.2.5 Edit NSX-V Edge Gateway

To edit an NSX-V edge gateway, use the following request:

**PUT /edge_gateways/:id.xml**

**PUT /edge_gateways/:id.json**

**XML Request Example**

```
curl -i -X PUT http://onapp.test/edge_gateways/12.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<edge_gateway><label>R1</label><description>abcde</description><ha_enabled>0</ha_enabled><configure_gateway>true</configure_gateway><default_gateway>10.0.0.2</default_gateway><use_default_route_for_dns Relay>true</use_default_route_for_dns_relay><external_network_configurations_attributes type="array"><element><id>1</id><enable_rate_limits>true</enable_rate_limits><incoming_rate_limit>101.0</incoming_rate_limit><outgoing_rate_limit>102.0</outgoing_rate_limit></element><element><id>2</id><participate>false</participate><ip_address>199.51.100.4</ip_address></element><element><id>3</id><participate>true</participate><auto_ip_assignment>false</auto_ip_assignment><ip_address>10.0.0.10</ip_address></element><element><id>4</id><participate>true</participate><auto_ip_assignment>false</auto_ip_assignment><ip_address>10.0.0.10</ip_address></element></external_network_configurations_attributes></edge_gateway>'
```

**JSON Request Example**

```
curl -i -X PUT http://onapp.test/edge_gateways/12.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"edge_gateway": {"label": "R1", "description": "abcde", "ha_enabled": "0", "configure_gateway": "true", "default_gateway": "10.0.0.2", "use_default_route_for_dns Relay": "true", "external_network_configurations_attributes": [{"id": "1", "enable_rate_limits": "true", "incoming_rate_limit": "101.0", "outgoing_rate_limit": "102.0", "ip_net_configurations_attributes": [{"id": "1", "participate": "false"}, {"id": "2", "participate": "true", "auto_ip_assignment": "false", "ip_address": "199.51.100.4"}], "2": [{"id": "3", "participate": "true", "auto_ip_assignment": "false", "ip_address": "10.0.0.10"}]}, {"id": "2", "ip_net_configurations_attributes": [{"id": "4", "participate": "true", "auto_ip_assignment": "true"}]}]}}
```

Where:

To edit the edge gateway:

- **label** - the name of the edge gateway
- **description** - the description of the edge gateway by the admin
- **ha_enabled** - true if high availability option is enabled for this edge gateway; otherwise, false

To edit the default gateway:

- **configure_gateway** - true if the automatic configuration of the default gateway is enabled; otherwise, false
- `default_gateway` - the default gateway
- `use_default_route_for_dns_relay` - `true` if the default route for DNS relay is used; otherwise, `false`

`external_network_configuration_attributes` - an array of external network configuration attributes with the details:
- `id` - the ID of the external network which will be connected to the edge gateway
- `enable_rate_limits` - `true` if rate limits are enabled; otherwise, `false`
- `incoming_rate_limit` - the inbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mb/s.
- `outgoing_rate_limit` - the outbound rate limit in megabits per second. The default value is 100. The minimal value is 0,001 Mb/s.

`ip_net_configurations_attributes` - the attributes of the IP net as follows:
- `id` - the ID of the IP net
- `participate` - `true` if the IP address is assigned for each of the subnets; otherwise, `false`
- `auto_ip_assignment` - `true` if you want to configure the IP address manually; otherwise, `false`
- `ip_address` - the IP address of the IP net

`id` - the ID of the edge gateway

**Page History**

v.6.0

- added the following parameters:
  - `configure_gateway`
  - `default_gateway`
  - `enable_rate_limits`
  - `incoming_rate_limit`
  - `outgoing_rate_limit`
  - `participate`
  - `auto_ip_assignment`
  - `ip_address`
- removed the `external_network_ids` parameter

3.20.2.6 Edit External Networks

To add new or remove existing external networks, use the following request:

PUT /edge_gateways/:id.xml

PUT /edge_gateways/:id.json

**XML Request Example**
### JSON Request Example

```
curl -i -X PUT http://onapp.test/edge_gateways/12.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{ "edge_gateway": { "external_network_ids": ["2", "3"] } }'
```

Where:

- `external_network_ids` - the IDs of the external networks which will be connected to the edge gateway

### 3.20.2.7 Delete NSX-V Edge Gateway

To delete an edge gateway, use the following request:

```
DELETE /edge_gateways/:id.xml
DELETE /edge_gateways/:id.json
```

### XML Request Example

```
curl -i -X DELETE http://onapp.test/edge_gateways/12.xml -u user:userpass
```

### JSON Request Example

```
curl -i -X DELETE http://onapp.test/edge_gateways/12.json -u user:userpass
```

### 3.20.2.8 Convert Edge Gateways to Advanced Edge Gateways

This step is only necessary if you are using older versions of vCloud Director including but not limited to 9.1 or 9.5.

To convert an edge gateway to an advanced edge gateway that is required to use NSX for vCloud at OnApp, use the following request:

```
PUT /edge_gateways/:edge_gateway_id/convert_to_advanced.xml
PUT /edge_gateways/:edge_gateway_id/convert_to_advanced.json
```

### XML Request Example

```
```

### JSON Request Example

```
curl -i -X PUT http://onapp.test/edge_gateways/1/convert_to_advanced.json -u user:userpass
```
3.20.3 NSX-V Firewalls API

Edge Firewall monitors the North-South traffic to provide perimeter security functionality including firewall, Network Address Translation (NAT), and site-to-site IPSec and SSL VPN functionality. You may set up specifications of the accepted or denied data and its paths to ensure a secure connection between the internal and external networks. This section contains the API requests you can use to manage NSX-V firewalls:

- Get NSX-V Firewall Service Details
- Edit NSX-V Firewall Service
- Get List of NSX-V Firewall Rules
- Get NSX-V Firewall Rule Details
- Add NSX-V Firewall Rule
- Edit NSX-V Firewall Rule
- Delete NSX-V Firewall Rule

3.20.3.1 Get NSX-V Firewall Service Details

To get NSX-V firewall service details, use the following request:

GET /nsx/edges/:edge_id/firewall/service.xml
GET /nsx/edges/:edge_id/firewall/service.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example

```
<nsx_firewall_service>
  <id type="integer">3</id>
  <enabled type="boolean">true</enabled>
  <edge_id type="integer">3</edge_id>
  <created_at type="dateTime">2019-11-06T10:16:49Z</created_at>
  <updated_at type="dateTime">2019-11-06T10:35:59Z</updated_at>
  <locked type="boolean">false</locked>
</nsx_firewall_service>
```

Where:
id - ID of the firewall service

enabled - true, if the service is enabled; otherwise, false

device_id - ID of the device the firewall service is assigned to

created_at - the date when the firewall service was created in the [YYYY][MM][DD][hh][mm][ss]Z format

updated_at - the date when the firewall service was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

locked - true, if the firewall service is locked; otherwise, false

3.20.3.2 Edit NSX-V Firewall Service

To edit an NSX-V firewall service, use the following request:

PUT /nsx/edges/:edge_id/firewall/service.xml
PUT /nsx/edges/:edge_id/firewall/service.json

XML Request Example

curl -i -X PUT http://onapp.test/nsx/edges/4/firewall/service.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<nsx_firewall_service><enabled type="boolean">true</enabled><firewall_rules type="array"><firewall_rule><enabled type="boolean">true</enabled><label>Rule 2</label><source_excluded type="boolean">false</source_excluded><destination_excluded type="boolean">true</destination_excluded><action>deny</action><logging type="boolean">false</logging><sources type="array"><source><target_type>Nsx::Firewall::Rules::IpAddress</target_type><value>192.168.0.1</value></source><source><target_type>Nsx::NetworkInterface</target_type><value>vnic-0</value></source></sources><destinations type="array"><destination><target_type>Nsx::Firewall::Rules::IpAddress</target_type><value>192.168.1.1</value></destination><destination><target_type>Nsx::NetworkInterface</target_type><value>vnic-0</value></destination></destinations><services type="array"><service><protocol>tcp</protocol><source_port>3333</source_port><destination_port>4444</destination_port></service><service><protocol>icmp</protocol></service></services></firewall_rule></firewall_rules></nsx_firewall_service>'

JSON Request Example

curl -i -X PUT http://onapp.test/nsx/edges/4/firewall/service.json -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"nsx_firewall_service": {"enabled": true,"firewall_rules": [{"enabled": true, "label": "Rule 2", "rule_type": "user", "source_excluded": false, "destination_excluded": true, "action": "deny", "logging": false, "sources": [{"target_type": "Nsx::Firewall::Rules::IpAddress", "value": "192.168.0.1"}, {"target_type": "Nsx::NetworkInterface", "value": "vnic-0"}], "destinations": [{"target_type": "Nsx::Firewall::Rules::IpAddress", "value": "192.168.1.1"}, {"target_type": "Nsx::NetworkInterface", "value": "vnic-0"}], "services": [{"protocol": "tcp", "source_port": "3333", "destination_port": "4444"}, {"protocol": "icmp"}]}]}}'

Where:

enabled - true, if firewall service is enabled; otherwise, false

firewall_rules:
• enabled - true, if NSX-V firewall rule is enabled; otherwise, false
• label - label of NSX-V firewall rule
• rule_type - user
• source_excluded - true, if toggle exclusion for this source is enabled; otherwise, false
• destination_excluded - true, if toggle exclusion for this destination is enabled; otherwise, false
• action - accept or deny
• logging - true, if logging for this rule is enabled; otherwise, false
• sources:
  - target_type - Nsx::Network, Nsx::VirtualMachine, Nsx::IpSet, Nsx::SecurityGroup, Nsx::Firewall::Rules::IpAddress or Nsx::NetworkInterface
  - value - moref of the selected target (depending on the chosen target type)
• destinations:
  - target_type - Nsx::Network, Nsx::VirtualMachine, Nsx::IpSet, Nsx::SecurityGroup, Nsx::Firewall::Rules::IpAddress or Nsx::NetworkInterface
  - value - moref of the selected target (depending on the chosen target type)
• services:
  - protocol - any, tcp, udp or icpm
  - source_port - the source port
  - destination_port - the destination port

3.20.3.3 Get List of NSX-V Firewall Rules
To get the list of NSX-V firewall rules assigned to a specific edge in your cloud, use the following request:

GET /nsx/edges/:edge_id/firewall/service/rules.xml
GET /nsx/edges/:edge_id/firewall/service/rules.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**
<nsx_firewall_rules type="array">
  <nsx_firewall_rule>
    <id type="integer">14</id>
    <identifier>131074</identifier>
    <enabled type="boolean">true</enabled>
    <label>firewall</label>
    <rule_type>internal_high</rule_type>
    <action>accept</action>
    <logging type="boolean">false</logging>
    <firewall_service_id type="integer">3</firewall_service_id>
    <created_at type="dateTime">2019-11-06T10:16:49Z</created_at>
    <updated_at type="dateTime">2019-11-06T10:16:49Z</updated_at>
    <source_excluded type="boolean">false</source_excluded>
    <destination_excluded type="boolean">false</destination_excluded>
  </nsx_firewall_rule>
  <nsx_firewall_rule>
    <id type="integer">15</id>
    <identifier>133138</identifier>
    <enabled type="boolean">true</enabled>
    <label>New Rule</label>
    <rule_type>user</rule_type>
    <action>accept</action>
    <logging type="boolean">false</logging>
    <firewall_service_id type="integer">3</firewall_service_id>
    <created_at type="dateTime">2019-11-06T10:16:49Z</created_at>
    <updated_at type="dateTime">2019-11-06T10:16:49Z</updated_at>
    <source_excluded type="boolean">false</source_excluded>
    <destination_excluded type="boolean">false</destination_excluded>
  </nsx_firewall_rule>
</nsx_firewall_rules>

Where:

id - ID of the NSX-V firewall rule

identifier - identifier of the firewall rule

enabled - true, if the rule is enabled; otherwise, false

label - label of the firewall rule

rule_type - internal_high, user or default_policy

action - accept or deny

logging - true, if logging for this firewall rule is enabled; otherwise, false

firewall_service_id - ID of the firewall service the rule is assigned to

created_at - the date when the firewall rule was created in the [YYYY][MM][DD][hh][mm][ss]Z format

updated_at - the date when the firewall rule was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

source_excluded - true, if toggle exclusion for this source is enabled; otherwise, false

destination_excluded - true, if toggle exclusion for this destination is enabled; otherwise, false

3.20.3.4 Get NSX-V Firewall Rule Details

To get NSX-V firewall rule details, use the following request:

GET /nsx/edges/:edge_id/firewall/service/rules/:rule_id.xml
GET /nsx/edges/:edge_id/firewall/service/rules/:rule_id.json
XML Request Example

```
```

JSON Request Example

```
```

XML Output Example

```
<nsx_firewall_rule>
  <id type="integer">15</id>
  <identifier>133138</identifier>
  <enabled type="boolean">true</enabled>
  <label>New Rule</label>
  <rule_type>user</rule_type>
  <action>accept</action>
  <logging type="boolean">false</logging>
  <firewall_service_id type="integer">3</firewall_service_id>
  <created_at type="dateTime">2019-11-06T10:16:49Z</created_at>
  <updated_at type="dateTime">2019-11-06T10:16:49Z</updated_at>
  <source_excluded type="boolean">false</source_excluded>
  <destination_excluded type="boolean">false</destination_excluded>
</nsx_firewall_rule>
```

Where:
- **id** - ID of the NSX-V firewall rule
- **identifier** - identifier of the NSX-V firewall rule
- **enabled** - **true**, if the rule is enabled; otherwise, **false**
- **label** - label of the NSX-V firewall rule
- **rule_type** - **internal_high**, **user** or **default_policy**
- **action** - **accept** or **deny**
- **logging** - **true**, if logging for this firewall rule is enabled; otherwise, **false**
- **firewall_service_id** - ID of the firewall service the rule is assigned to
- **created_at** - the date when the firewall rule was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the firewall rule was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- **source_excluded** - **true**, if toggle exclusion for this source is enabled; otherwise, **false**
- **destination_excluded** - **true**, if toggle exclusion for this destination is enabled; otherwise, **false**

3.20.3.5 Add NSX-V Firewall Rule
To add an NSX-V firewall rule, use the following request:
POST /nsx/edges/:edge_id/firewall/service/rules.xml
POST /nsx/edges/:edge_id/firewall/service/rules.json

XML Request Example

```
curl -i -X POST -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url http://onapp.test/nsx/edges/3/firewall/service/rules.xml -d '=<nsx_firewall_rule><enabled type="boolean">true</enabled><label>Rule 2</label><source_excluded type="boolean">false</source_excluded><destination_excluded type="boolean">true</destination_excluded><action>deny</action><logging type="boolean">false</logging><sources type="array"><source><target_type>Nsx::Firewall::Rules::IpAddress</target_type><value>192.168.0.1</value></source><source><target_type>Nsx::NetworkInterface</target_type><value>vnic-0</value></source></sources><destinations type="array"><destination><target_type>Nsx::Firewall::Rules::IpAddress</target_type><value>192.168.0.1</value></destination><destination><target_type>Nsx::NetworkInterface</target_type><value>vnic-0</value></destination></destinations><services type="array"><service><protocol>tcp</protocol><source_port>3333</source_port><destination_port>4444</destination_port></service><service><protocol>icmp</protocol></service></services></nsx_firewall_rule>'
```

JSON Request Example

```
curl -i -X POST -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --url http://onapp.test/nsx/edges/3/firewall/service/rules.json -d '{"nsx_firewall_rule": {"enabled": true, "label": "Rule 2", "rule_type": "user", "source_excluded": false, "destination_excluded": true, "action": "deny", "logging": false, "sources": [{"target_type": "Nsx::Firewall::Rules::IpAddress", "value": "192.168.0.1"}, {"target_type": "Nsx::NetworkInterface", "value": "vnic-0"}], "destinations": [{"target_type": "Nsx::Firewall::Rules::IpAddress", "value": "192.168.1.1"}, {"target_type": "Nsx::NetworkInterface", "value": "vnic-0"}], "services": [{"protocol": "udp", "source_port": "1111", "destination_port": "2222"}, {"protocol": "icmp"}]}]}'
```

Where:

- **enabled**: true, if IPSec VPN site is enabled; otherwise, false
- **label**: the label of the NSX-V firewall rule
- **rule_type**: user
- **source_excluded**: true, if toggle exclusion for this source is enabled; otherwise, false
- **destination_excluded**: true, if toggle exclusion for this destination is enabled; otherwise, false
- **action**: accept or deny
- **logging**: true, if logging for this rule is enabled; otherwise, false
- **sources**:
  - target_type: Nsx::Network, Nsx::VirtualMachine, Nsx::IpSet, Nsx::SecurityGroup, Nsx::Firewall::Rules::IpAddress or Nsx::NetworkInterface
  - value: moref of the selected target (depending on the chosen target type)
- **destinations**
- target_type - Nsx::Network, Nsx::VirtualMachine, Nsx::IpSet, Nsx::SecurityGroup, Nsx::Firewall::Rules::IpAddress or Nsx::NetworkInterface
- value - moreref of the selected target (depending on the chosen target type)

services:
- protocol - any, tcp, udp or icpm
- source_port - the source port
- destination_port - the destination port

3.20.3.6 Edit NSX-V Firewall Rule
To edit an NSX-V firewall rule, use the following request:

PUT /nsx/edges/:edge_id/firewall/service/rules/:rule_id.xml
PUT /nsx/edges/:edge_id/firewall/service/rules/:rule_id.json

XML Request Example

curl -i -X PUT http://onapp.test/nsx/edges/45/firewall/service/rules/56.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<nsx_firewall_rule><enabled type="boolean">true</enabled><label>Rule 2</label><source_excluded type="boolean">false</source_excluded><destination_excluded type="boolean">true</destination_excluded><action>deny</action><logging type="boolean">false</logging><sources type="array"><source><target_type>Nsx::Firewall::Rules::IpAddress</target_type><value>192.168.0.1</value></source><source><target_type>Nsx::NetworkInterface</target_type><value>vmnic-0</value></source></sources><destinations type="array"><destination><target_type>Nsx::Firewall::Rules::IpAddress</target_type><value>192.168.1.1</value></destination><destination><target_type>Nsx::NetworkInterface</target_type><value>vmnic-0</value></destination></destinations><services type="array"><service><protocol>tcp</protocol><source_port>3333</source_port><destination_port>4444</destination_port></service><service><protocol>icmp</protocol></service></services></nsx_firewall_rule>'

JSON Request Example

Where:
- enabled - true, if firewall rule is enabled; otherwise, false
- label - the label of the firewall rule
rule_type - user
source_excluded - true, if toggle exclusion for this source is enabled; otherwise, false
destination_excluded - true, if toggle exclusion for this destination is enabled; otherwise, false
action - accept or deny
logging - true, if logging for this rule is enabled; otherwise, false

sources:
- target_type - Nsx::Network, Nsx::VirtualMachine, Nsx::IpSet, Nsx::SecurityGroup,
  Nsx::Firewall::Rules::IpAddress or Nsx::NetworkInterface
- value - moref of the selected target (depending on the chosen target type)

destinations:
- target_type - Nsx::Network, Nsx::VirtualMachine, Nsx::IpSet, Nsx::SecurityGroup,
  Nsx::Firewall::Rules::IpAddress or Nsx::NetworkInterface
- value - moref of the selected target (depending on the chosen target type)

services:
- protocol - any, tcp, udp, icmp
- source_port - the source port
- destination_port - the destination port

3.20.3.7 Delete NSX-V Firewall Rule
To delete an NSX firewall rule, use the following request:

DELETE /nsx/edges/:edge_id/firewall/service/rules/:rule_id.xml
DELETE /nsx/edges/:edge_id/firewall/service/rules/:rule_id.json

XML Request example

```
curl -i -X DELETE -u user:userpass
http://onapp.test/edges/45/firewall/service/rules/56.xml
-H 'Accept: application/xml'
-H 'Content-type: application/xml'
```

JSON Request Example

```
curl -i -X DELETE -u user:userpass
http://onapp.test/edges/45/firewall/service/rules/56.json
-H 'Accept: application/json'
-H 'Content-type: application/json'
```

Returns HTTP 204 response on successful deletion, or HTTP 404 when a firewall with the ID specified is not found.

3.20.4 NSX-V IPSec VPN API

Internet Protocol Security (IPSec) VPN ensures secure and private communications over Internet Protocol (IP) networks. It authenticates and encrypts IP packets between two endpoints. This section contains the API requests you can use to manage NSX-V IPSec VPN service and IPSec VPN sites.

3.20.4.1 NSX-V IPSec VPN Service
Below you can find the list of operations applicable for NSX-V IPSec VPN services:

- Get IPSec VPN Service Details
• Edit IPSec VPN Service

3.20.4.1.1 Get IPSec VPN Service Details
To get IPSec VPN service details, use the following request:
GET /nsx/edges/:edge_id/vpn/ipsec/service.xml
GET /nsx/edges/:edge_id/vpn/ipsec/service.json

XML Request Example
```
```

JSON Request Example
```
```

XML Output Example
```
<nsx_ipsec_service>
  <id type="integer">116</id>
  <enabled type="boolean">true</enabled>
  <logging type="boolean">true</logging>
  <edge_id type="integer">126</edge_id>
  <service_certificate_id type="integer">205</service_certificate_id>
  <psk>testkey</psk>
  <log_level>info</log_level>
  <created_at type="dateTime">2019-11-06T13:01:09Z</created_at>
  <updated_at type="dateTime">2019-11-06T13:01:09Z</updated_at>
  <locked type="boolean">false</locked>
</nsx_ipsec_service>
```

Where:
- id - ID of the IPSec VPN service
- enabled - true, if IPSec VPN service is enabled; otherwise, false
- logging - true, if logging for this IPSec VPN service is enabled; otherwise, false
- edge_id - ID of the edge this IPSec VPN service was created for
- service_certificate_id - ID of the service certificate
- psk - the value of the pre-shared key
- log_level - emergency, alert, critical, error, warning, notice, info or debug
- created_at - the date when the IPSec VPN service was created in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
- updated_at - the date when the IPSec VPN service was updated in the [YYYY][MM][DD][T][hh][mm][ss][Z] format
- locked - true, if IPSec VPN service is locked; otherwise, false

3.20.4.1.2 Edit IPSec VPN Service
To edit IPSec VPN service, use the following request:
PUT /nsx/edges/:edge_id/vpn/ipsec/service.xml
PUT /nsx/edges/:edge_id/vpn/ipsec/service.json

**XML Request Example**

```bash
curl -i -X PUT -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:pass -u -d '...'
```

**JSON Request Example**

```bash
curl -i -X PUT -H 'Accept: application/json' -H 'Content-type: application/json' -u user:pass -u -d '{...}'
```

**Where:**

- `enabled` - `true`, if IPSec VPN service is enabled; otherwise, `false`
- `logging` - `true`, if logging for IPSec VPN service is enabled; otherwise, `false`
- `log_level` - `emergency`, `alert`, `critical`, `error`, `warning`, `notice`, `info` or `debug`
- `psk` - the value of the pre-shared key
- `service_certificate` - identifier of the service certificate (optional; required if any IPSec site uses certificate authentication)
- `ca_certificates` - identifiers of the CA certificates
- `crl_certificates` - identifiers of the CRL certificates
- `certificate_auth_enabled` - `true`, if certificate authentication is enabled; otherwise, `false`

**ipsec_sites:**

- `enabled` - `true`, if IPSec VPN site is enabled; otherwise, `false` (local IP must be assigned to an Edge's Uplink vNIC)
- `label` - label of an IPSec VPN site
• **local_id** - ID of the local site
• **local_ip** - IP of the local site (local IP must be assigned to an Edge's Uplink vNIC)
• **peer_id** - ID of a peer site (for certificate authentication must be a valid Distinguished Name)
• **peer_ip** - IP or FQDN of a peer site
• **ipsec_session_type** - policybasedsession or routebasedsession. If routebasedsession is selected:
  o **tunnel_interface_ip** - tunnel interface IP in CIDR notation
  o **tunnel_interface_mtu** - MTU, allowed values 152 - 8916 (inclusively)
• **encryption_algorithm** - aes, aes256, aes-gsm, or 3des
• **enable_pfs** - true, if PFS is enabled; otherwise, false
• **dh_group** - dh2, dh5, dh14, dh15, or dh16
• **psk** - the value of the pre-shared key
• **authentication_mode** - psk or x.509 (for Certificate mode; available only if service_certificate for a service is set)
• **digest_algorithm** - sha1 or sha-256
• **responder_only** - true, if IKE Responder Only option is enabled; otherwise, false
• **compliance_suite** - none, cnsa, prime, suite-b-gcm-128, suite-b-gcm-256, suite-b-gmac-128, suite-b-gmac-256, or foundation
• **ike_option** - ikev1, ikev2, or ike-flex
• **local_subnets** - an array of local subnets in CIDR format (If routebasedsession is set for ipsec_session_type, local_subnets value should be "["0.0.0.0/0"]")
• **peer_subnets** - an array of peer subnets in CIDR format (If routebasedsession is set for ipsec_session_type, peer_subnets value should be "["0.0.0.0/0"]")

3.20.4.2 NSX-V IPSec VPN Sites
Below you can find the list of operations applicable for NSX-V IPSec VPN sites:

- **Get List of IPSec VPN Sites**
- **Get IPSec VPN Site Details**
- **Add IPSec VPN Site**
- **Edit IPSec VPN Site**
- **Delete IPSec VPN Site**

3.20.4.2.1 Get List of IPSec VPN Sites
To get the list of IPSec VPN sites, use the following request:

GET /nsx/edges/:edge_id/vpn/ipsec/service/sites.xml
GET /nsx/edges/:edge_id/vpn/ipsec/service/sites.json

**XML Request Example**

**JSON Request Example**
<nsx_ipsec_sites type="array">
  <nsx_ipsec_site>
    <id type="integer">735</id>
    <enabled type="boolean">false</enabled>
    <label>Alpha</label>
    <identifier>ipsite-170</identifier>
    <ipsec_service_id type="integer">116</ipsec_service_id>
    <local_id>123123213123123123123</local_id>
    <local_ip>10.0.0.133</local_ip>
    <peer_id>123123213123123123123</peer_id>
    <peer_ip>123.23.3.3</peer_ip>
    <ipsec_session_type>policybasedsession</ipsec_session_type>
    <encryption_algorithm>aes</encryption_algorithm>
    <enable_pfs type="boolean">false</enable_pfs>
    <dh_group>dh5</dh_group>
    <tunnel_interface_ip_address nil="true"/>
    <tunnel_interface_mtu nil="true"/>
    <local_subnets type="array">
      <local_subnet>0.0.0.0/0</local_subnet>
    </local_subnets>
    <peer_subnets type="array">
      <peer_subnet>0.0.0.0/0</peer_subnet>
    </peer_subnets>
    <psk>:SLEFPKLFEP|SEKFSEP|KFSP|SEF<MESE<FSEFS</psk>
    <authentication_mode>psk</authentication_mode>
    <extension></extension>
    <digest_algorithm>sha1</digest_algorithm>
    <responder_only type="boolean">false</responder_only>
    <IKE_option>ikev1</IKE_option>
    <certificate_id nil="true"/>
  </nsx_ipsec_site>
  <nsx_ipsec_site>
    <id type="integer">736</id>
    <enabled type="boolean">false</enabled>
    <label>Subnet</label>
    <identifier>ipsite-171</identifier>
    <ipsec_service_id type="integer">116</ipsec_service_id>
    <local_id>10.0.0.133</local_id>
    <local_ip>10.0.0.133</local_ip>
    <peer_id>123.32.3.3</peer_id>
    <peer_ip>123.32.3.3</peer_ip>
    <ipsec_session_type>policybasedsession</ipsec_session_type>
    <encryption_algorithm>aes-gcm</encryption_algorithm>
    <enable_pfs type="boolean">false</enable_pfs>
    <dh_group>dh15</dh_group>
    <tunnel_interface_ip_address nil="true"/>
    <tunnel_interface_mtu nil="true"/>
    <local_subnets type="array">
      <local_subnet>122.123.23.128/32</local_subnet>
    </local_subnets>
    <peer_subnets type="array">
      <peer_subnet>123.32.3.0/24</peer_subnet>
    </peer_subnets>
    <psk>sadaDL,awdawdawdAWLD<:LW<AL:d,a;wD<L</psk>
    <authentication_mode>psk</authentication_mode>
    <extension></extension>
    <digest_algorithm>sha-256</digest_algorithm>
    <responder_only type="boolean">false</responder_only>
    <IKE_option>ike-flex</IKE_option>
    <certificate_id nil="true"/>
  </nsx_ipsec_site>
</nsx_ipsec_sites>
Where:

id - ID of the IPSec VPN site
enabled - true, if IPSec VPN site is enabled; otherwise, false
label - the label of the IPSec VPN site
identifier - identifier of the IPSec VPN site
ipsec_service_id - ID of the IPSec VPN service
local_id - ID of the local site
local_ip - IP of the local site
peer_id - ID of a peer site
peer_ip - IP of a peer site
ipsec_session_type - policybasedsession or routebasedsession. If ipsec_session_type is set to routebasedsession:
  • tunnel_interface_ip - tunnel interface IP in CIDR notation
  • tunnel_interface_mtu - MTU, allowed values 152 - 8916 (inclusively)
enetration_algorithm - aes, aes256, aes-gsm, or 3des
enable_pfs - true, if PFS is enabled; otherwise, false
dh_group - dh2, dh5, dh14, dh15, or dh16
local_subnets - an array of local subnets in CIDR format
peer_subnets - an array of peer subnets in CIDR format
psk - the value of the pre-shared key
authentication_mode - psk or x.509 (for Certificate mode)
extension - securelocaltrafficbyip=IPAddress or passthroughSubnets=PeerSubnetIPAddress
digest_algorithm - sha1 or sha-256
responder_only - true, if IKE Responder Only option is enabled; otherwise, false
compliance_suite - none, cnsa, prime, suite-b-gcm-128, suite-b-gcm-256, suite-b-gmac-128, suite-b-gmac-256, or foundation
ike_option - ikev1, ikev2, or ike-flex
certificate_id - identifier of the certificate

3.20.4.2.2 Get IPSec VPN Site Details
To get the IPSec VPN site details, use the following request:

GET /nsx/edges/:edge_id/vpn/ipsec/service/sites/:site_id.xml
GET /nsx/edges/:edge_id/vpn/ipsec/service/sites/:site_id.json

XML request Example

```
```

JSON Request Example
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

XML Output Example

```xml
<nsx_ipsec_site>
  <id type="integer">735</id>
  <enabled type="boolean">false</enabled>
  <label>Alpha</label>
  <identifier>ipsecsite-170</identifier>
  <ipsec_service_id type="integer">116</ipsec_service_id>
  <local_id>1231232132123123123</local_id>
  <local_ip>10.0.0.133</local_ip>
  <peer_id>1231232132123123123</peer_id>
  <peer_ip>123.23.3.3</peer_ip>
  <ipsec_session_type>policybasedsession</ipsec_session_type>
  <encryption_algorithm>aes</encryption_algorithm>
  <enable_pfs type="boolean">false</enable_pfs>
  <dh_group>dh5</dh_group>
  <tunnel_interface_ip_address nil="true"/>
  <tunnel_interface_mtu nil="true"/>
  <local_subnets type="array">
    <local_subnet>0.0.0.0/0</local_subnet>
  </local_subnets>
  <peer_subnets type="array">
    <peer_subnet>0.0.0.0/0</peer_subnet>
  </peer_subnets>
  <psk>:SLEFSKLFLFPSEKFSKFSEFSEFS<f</psk>
  <authentication_mode>psk</authentication_mode>
  <digest_algorithm>sha1</digest_algorithm>
  <responder_only type="boolean">false</responder_only>
  <ike_option>ikev1</ike_option>
  <certificate_id nil="true"/>
</nsx_ipsec_site>

Where:

- **id** - ID of the IPSec VPN site
- **enabled** - true, if IPSec VPN site is enabled; otherwise, false
- **label** - label of the IPSec VPN site
- **identifier** - identifier of the IPSec VPN site
- **ipsec_service_id** - ID of the IPSec VPN service
- **local_id** - ID of the local site
- **local_ip** - IP of the local site
- **peer_id** - ID of a peer site
- **peer_ip** - IP of a peer site
- **ipsec_session_type** - policybasedsession or routebasedsession. If **ipsec_session_type** is set to routebasedsession:
  - **tunnel_interface_ip** - tunnel interface IP in CIDR notation
  - **tunnel_interface_mtu** - MTU, allowed values 152 - 8916(inclusively)
encryption_algorithm - aes, aes256, aes-gsm, or 3des
enable_pfs - true, if PFS is enabled; otherwise, false
dh_group - dh2, dh5, dh14, dh15, or dh16
local_subnets - an array of local subnets in CIDR format
peer_subnets - an array of peer subnets in CIDR format
psk - the value of the pre-shared key
authentication_mode - psk or x.509 (for Certificate mode)
extension - securelocaltrafficbyip=IPAddress or passthroughSubnets=PeerSubnet IPAddress
digest_algorithm - sha1 or sha-256
responder_only - true, if IKE Responder Only option is enabled; otherwise, false
ike_option - ikev1, ikev2, or ike-flex
certificate_id - identifier of the certificate

3.20.4.2.3 Add IPSec VPN Site
To add an IPSec VPN site, use the following request:
POST /nsx/edges/:edge_id/vpn/ipsec/service/sites.xml
POST /nsx/edges/:edge_id/vpn/ipsec/service/sites.json

XML Request Example
```xml
curl -i -X POST -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url http://onapp.test/"nsx/edges/113/vpn/ipsec/service/sites.xml" -d "<nsx_ipsec_site><authentication_mode>x.509</authentication_mode><certificate>certificate-45</certificate><compliance_suite>none</compliance_suite><dh_group>dh5</dh_group><digest_algorithm>sha-256</digest_algorithm><enable_pfs>false</enable_pfs><enabled>false</enabled><encryption_algorithm>aes-gcm</encryption_algorithm><extension /><ike_option>ike-flex</ike_option><ipsec_session_type>routebasedsession</ipsec_session_type><label>Bravo</label><local_id>10.0.0.133</local_id><local_ip>10.0.0.133</local_ip><local_subnets type="array"><local_subnet>0.0.0.0/0</local_subnet></local_subnets><peer_id>C=Test, L=host</peer_id><peer_ip>123.32.4.32</peer_ip><peer_subnets type="array"><peer_subnet>0.0.0.0/0</peer_subnet></peer_subnets><responder_only>false</responder_only><tunnel_interface_ip_address>23.23.21.23/24</tunnel_interface_ip_address><tunnel_interface_mtu>1500</tunnel_interface_mtu>"></nsx_ipsec_site>"
```

JSON Request Example
```json
curl -i -X POST -H 'Content-type: application/json' -u user:userpass --url http://onapp.test/"nsx/edges/113/vpn/ipsec/service/sites.json" -d '{ "nsx_ipsec_site": { "authentication_mode": "x.509", "certificate": "certificate-45", "compliance_suite": "none", "dh_group": "dh5", "digest_algorithm": "sha-256", "enable_pfs": false, "enabled": false, "encryption_algorithm": "aes-gcm", "extension": "", "ike_option": "ike-flex", "ipsec_session_type": "routebasedsession", "label": "Bravo", "local_id": "10.0.0.133", "local_ip": "10.0.0.133", "local_subnets": [ { "local_subnet": "0.0.0.0/0" } ], "peer_id": "C=Test, L=host", "peer_ip": "123.32.4.32", "peer_subnets": [ { "peer_subnet": "0.0.0.0/0" } ], "responder_only": false, "tunnel_interface_ip_address": "23.23.21.23/24", "tunnel_interface_mtu": 1500 } }'"
curl -i -X POST -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --url http://onapp.test/nsx/edges/113/vpn/ipsec/service/sites.json -d '{"nsx_ipsec_site": {"enabled": false, "label": "Bravo", "local_id": "10.0.0.133", "local_ip": "10.0.0.133", "peer_id": "C=Test, L=host", "peer_ip": "123.32.4.32", "ipsec_session_type": "routebasedsession", "encryption_algorithm": "aes-gcm", "enable_pfs": false, "dh_group": "dh5", "tunnel_interface_ip_address": "23.23.21.23/24", "tunnel_interface_mtu": 1500, "local_subnets": ["0.0.0.0/0"], "peer_subnets": ["0.0.0.0/0"], "authentication_mode": "x.509", "extension": "", "digest_algorithm": "sha-256", "responder_only": false, "compliance_suite": "none", "ike_option": "ike-flex", "certificate": "certificate-45"}}

Where:

- **enabled** - true, if IPSec VPN site is enabled; otherwise, false (local IP must be assigned to an Edge's Uplink vNIC)
- **label** - label of an IPSec VPN site
- **local_id** - ID of the local site
- **local_ip** - IP of the local site (local IP must be assigned to an Edge's Uplink vNIC)
- **peer_id** - ID of a peer site (for certificate authentication must be a valid Distinguished Name)
- **peer_ip** - IP or FQDN of a peer site
- **ipsec_session_type** - policybasedsession or routebasedsession. If routebasedsession is selected:
  - **tunnel_interface_ip** - tunnel interface IP in CIDR notation
  - **tunnel_interface_mtu** - MTU, allowed values 152 - 8916 (inclusively)
- **encryption_algorithm** - aes, aes256, aes-gsm, or 3des
- **enable_pfs** - true, if PFS is enabled; otherwise, false
- **dh_group** - dh2, dh5, dh14, dh15, or dh16
- **local_subnets** - an array of local subnets in CIDR format (If routebasedsession is set for ipsec_session_type, local_subnets value should be ["0.0.0.0/0"])  
- **peer_subnets** - an array of peer subnets in CIDR format (If routebasedsession is set for ipsec_session_type, peer_subnets value should be ["0.0.0.0/0"])  
- **authentication_mode** - psk or x.509 (for Certificate mode; available only if service_certificate for a service is set)  
- **extension** - securelocaltrafficbyip=IPAddress or passthroughSubnets=PeerSubnetIPAddress
- **digest_algorithm** - sha1 or sha-256
- **responder_only** - true, if IKE Responder Only option is enabled; otherwise, false
- **compliance_suite** - none, cnlsa, prime, suite-b-gcm-128, suite-b-gcm-256, suite-b-gmac-128, suite-b-gmac-256, or foundation
- **ike_option** - ikev1, ikev2, or ike-flex
- **certificate** - identifier of the certificate

3.20.4.2.4 Edit IPSec VPN Site
To edit an IPSec VPN site, use the following request:

PUT /nsx/edges/:edge_id/vpn/ipsec/service/sites/:site_id.xml
PUT /nsx/edges/:edge_id/vpn/ipsec/service/sites/:site_id.json
XML Request Example

curl -i -X PUT -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '<nsx_ipsec_site><authentication_mode>x.509</authentication_mode><certificate><certificate>certificate45</certificate><compliance_suite>none</compliance_suite><dh_group>dh5</dh_group><digest_algorithm>sha-256</digest_algorithm><enable_pfs>false</enable_pfs><encryption_algorithm>aes-gcm</encryption_algorithm><ike_option>ike-flex</ike_option><ipseckey_type>routebasedsession</ipseckey_type><label>Bravo</label><local_id>10.0.0.133</local_id><local_ip>10.0.0.133</local_ip><local_subnets><element>0.0.0.0/0</element></local_subnets><peer_id>C=Test, L=host</peer_id><peer_ip>123.32.4.32</peer_ip><peer_subnets><element>0.0.0.0/0</element></peer_subnets><tunnel_interface_ip_address>23.23.21.23/24</tunnel_interface_ip_address><tunnel_interface_mtu>1500</tunnel_interface_mtu></nsx_ipsec_site>'

JSON Request Example

curl -i -X PUT -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"nsx_ipsec_site": {"enabled": false, "label": "Bravo", "local_id": "10.0.0.133", "local_ip": "10.0.0.133", "peer_id": "C=Test, L=host", "peer_ip": "123.32.4.32", "ipseckey_type": "routebasedsession", "encryption_algorithm": "aes-gcm", "enable_pfs": false, "dh_group": "dh5", "tunnel_interface_ip_address": "23.23.21.23/24", "tunnel_interface_mtu": 1500, "local_subnets": ["0.0.0.0/0"], "peer_subnets": ["0.0.0.0/0"], "authentication_mode": "x.509", "extension": "", "digest_algorithm": "sha-256", "responder_only": false, "compliance_suite": "none", "ike_option": "ike-flex", "certificate": "certificate45"}}'}

Where:

- enabled* - true, if IPSec VPN site is enabled; otherwise, false
- label - label of the IPSec VPN site
- ipsec_service_id - ID of the IPSec VPN service
- local_id* - ID of the local site
- local_ip* - IP of the local site (local IP must be assigned to an Edge's Uplink vNIC)
- peer_id* - ID of a peer site (for certificate authentication must be a valid Distinguished Name)
- peer_ip* - IP or FQDN of a peer site
- ipsec_session_type - policybasedsession or routebasedsession. If routebasedsession is selected:
  - tunnel Interface_ip* - tunnel interface IP in CIDR notation
  - tunnel_interface_mtu* - MTU, allowed values 152 - 8916 (inclusively)
- encryption_algorithm* - aes, aes256, aes-gsm, or 3des
- enable_pfs* - true, if PFS is enabled; otherwise, false
dh_group* - dh2, dh5, dh14, dh15, or dh16

local_subnets* - an array of local subnets in CIDR format (If routebasedsession is set for ipsec_session_type, local_subnets value should be ["0.0.0.0/0"]) peer_subnets* - an array of peer subnets in CIDR format (If routebasedsession is set for ipsec_session_type, peer_subnets value should be ["0.0.0.0/0"]) authentication_mode* - psk or x.509 (for Certificate mode; available only if service_certificate for a service is set)

psk - the value of the pre-shared key
digest_algorithm* - sha1 or sha-256
responder_only - true, if IKE Responder Only option is enabled; otherwise, false
compliance_suite - none, cnsa, prime, suite-b-gcm-128, suite-b-gcm-256, suite-b-gmac-128, suite-b-gmac-256, or foundation
ike_option* - ikev1, ikev2, or ike-flex
certificate_id - identifier of the certificate

3.20.4.2.5 Delete IPSec VPN Site

To delete IPSec VPN site, use the following request:

DELETE /nsx/edges/:edge_id/vpn/ipsec/service/sites/:site_id.xml
DELETE /nsx/edges/:edge_id/vpn/ipsec/service/sites/:site_id.json

**XML Request Example**

```
curl -i -X DELETE -u user:userpass
```

**JSON Request Example**

```
curl -i -X DELETE -u user:userpass
```

Returns HTTP 204 response on successful deletion, or HTTP 404 when an IPSec VPN site with the ID specified is not found.

3.20.5 NSX-V L2 VPN API

This section provides the API calls you can use to manage NSX-V L2 VPN. With L2 VPN, you can stretch multiple logical networks (both VLAN and VXLAN) between different physical sites.

3.20.5.1 NSX-V L2 VPN Server

L2 VPN allows you to extend your data center by allowing virtual machines to retain network connectivity across geographical boundaries. Virtual servers remain on the same subnet when they are moved between sites and their IP addresses do not change. This section contains the API requests you can use to manage L2 VPN server:

- **Edit NSX-V L2 VPN Server**
- **Get List of L2 VPN Peer Sites**
- Get NSX-V L2 VPN Peer Site Details
- Add NSX-V L2 VPN Peer Site
- Edit NSX-V L2 VPN Peer Site
- Delete NSX-V L2 VPN Peer Site

3.20.5.1.1 Edit NSX-V L2 VPN Server

To edit an L2 VPN server, use the following request:

PUT /nsx/edges/:edge_id/vpn/l2_vpn/service.xml
PUT /nsx/edges/:edge_id/vpn/l2_vpn/service.json

**XML Request Example**

```sh
<nsx_l2_vpn_service>
  <certificate_auth_enabled>true</certificate_auth_enabled>
  <enabled>false</enabled>
  <encryption_algorithm type="array">
    <encryption_algorithm>ECDHE-RSA-SHA256</encryption_algorithm>
    <encryption_algorithm>ECDHE-RSA-AES128-GCM-SHA256</encryption_algorithm>
    <encryption_algorithm>ECDHE-RSA-AES256-GCM-SHA384</encryption_algorithm>
  </encryption_algorithm>
  <l2_vpn_peer_sites type="array">
    <l2_vpn_peer_site>
      <description>1</description>
      <egress_optimization type="array">
        <egress_optimization>123.43.21.3</egress_optimization>
      </egress_optimization>
      <enabled>true</enabled>
      <identifier>l2vpnpeersite-83</identifier>
      <label>Alpha</label>
      <routed_remote_subnets_enabled>false</routed_remote_subnets_enabled>
      <sub_interfaces type="array">
        <sub_interface>10</sub_interface>
        <sub_interface>11</sub_interface>
      </sub_interfaces>
      <user_id>newusername</user_id>
      <user_password>%b5u`=8G[vHHe`</user_password>
    </l2_vpn_peer_site>
  </l2_vpn_peer_sites>
  <listener_ip>10.0.0.133</listener_ip>
  <listener_port>443</listener_port>
  <mode>server</mode>
  <service_certificate>certificate-46</service_certificate>
</nsx_l2_vpn_service>
```

**JSON Request Example**

```sh
curl -i -X PUT -H 'Accept: application/json' -H 'Content-Type: application/json' -d '{
  "nsx_l2_vpn_service": {
    "enabled": false,
    "mode": "server",
    "listener_ip": "10.0.0.133",
    "listener_port": "443",
    "encryption_algorithm": ["ECDHE-RSA-AES128-GCM-SHA256", "ECDHE-RSA-AES256-GCM-SHA384"],
    "service_certificate": "certificate-46",
    "certificate_auth_enabled": true,
    "l2_vpn_peer_sites": [
      {"label": "Alpha", "identifier": "l2vpnpeersite-83", "enabled": true, "description": "1", "user_id": "newusername", "user_password": "%b5u`=8G[vHHe`", "egress_optimization": ["123.43.21.3"], "routed_remote_subnets_enabled": false, "sub_interfaces": ["10", "11"], "sub_interfaces": ["11"]}],
      {"label": "Bravo", "identifier": "l2vpnpeersite-84", "enabled": true, "description": "2", "user_id": "user2", "user_password": "Hv8u002Q+4UJst^vgz9", "egress_optimization": [], "routed_remote_subnets_enabled": false, "sub_interfaces": ["11"]}
    ]
  }
}'
```

Where:

- **enabled** - true if L2 VPN service is enabled; otherwise, false
- **mode** - server
- **listener_ip** - the primary or secondary IP address of an external interface of the NSX-V edge
listener_port* - the port number for the L2 VPN service

certificate_auth_enabled* - true if the certificate to be bound to the SSL VPN server is enabled; otherwise, false

l2_vpn_peer_sites - an array of L2 VPN peer sites added to this server with their details:
- description - the description of the peer site
- egress_optimization - the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel; an array of IP addresses ("192.168.1.1", "192.168.1.2") or comma-separated string("192.168.1.1, 192.168.1.2")
- enabled* - true if the newly added peer site is enabled; otherwise, false
- identifier - the identifier of the peer site
- label - the name of the peer site
- routed_remote_subnets_enabled - true if the sub interfaces to be stretched with the client are enabled; otherwise, false
- sub_interfaces* - the indexes of the sub interfaces
- user_id* - a user name with which the peer site is to be authenticated
- user_password* - a password with which the peer site is to be authenticated

3.20.5.1.2 Get List of L2 VPN Peer Sites
To view the list of L2 VPN peer sites on your cloud, use the following request:

GET /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites.xml
GET /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites.json

XML Request Example

JSON Request Example

XML Request Output
Where:

- **id** - the ID of the peer site
- **label** - the name of the peer site
- **identifier** - identifier of the peer site
- **description** - the description of a peer site
- **egress_optimization** - the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel
- **enabled** - true if the newly added peer site is enabled; otherwise, false
- **user_id** - the ID of a user of a peer site
- **user_password** - the password with which the peer site is to be authenticated
- **routed_remote_subnets_enabled** - true if the sub interfaces to be stretched with the client are enabled; otherwise, false
- **l2_vpn_service_id** - the ID of the VPN service attached
- **ca_certificate_id** - the ID of the CA certificate attached
- **created_at** - the date when the peer site was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the peer site was edited in the [YYYY][MM][DD][hh][mm][ss]Z format

### 3.20.5.1.3 Get NSX-V L2 VPN Peer Site Details

To get the details of a particular L2 VPN peer site, use the following request:

```plaintext
GET /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites/:peer_site_id.xml
GET /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites/:peer_site_id.js
```

**XML Request Example**

```
<nsx_l2_vpn_peer_sites type="array">
  <nsx_l2_vpn_peer_site>
    <id type="integer">732</id>
    <label>Alpha</label>
    <identifier>l2vpnpeersite-83</identifier>
    <description>1</description>
    <egress_optimization type="array">
      <egress_optimization>123.43.21.3</egress_optimization>
    </egress_optimization>
    <enabled type="boolean">true</enabled>
    <user_id>newusername</user_id>
    <user_password>%b5u`8G[GK$fHe`</user_password>
    <routed_remote_subnets_enabled type="boolean">false</routed_remote_subnets_enabled>
    <l2_vpn_service_id type="integer">100</l2_vpn_service_id>
    <ca_certificate_id nil="true"/>
    <created_at type="dateTime">2019-11-06T13:01:10Z</created_at>
    <updated_at type="dateTime">2019-11-06T13:01:10Z</updated_at>
  </nsx_l2_vpn_peer_site>
  ...
</nsx_l2vpn_peer_sites>
```

**JSON Request Example**

**XML Output Example**

```xml
<nsx_l2_vpn_peer_site>
  <id type="integer">732</id>
  <label>Alpha</label>
  <identifier>l2vpnpeersite-83</identifier>
  <description></description>
  <egress_optimization type="array">
    <egress_optimization>123.43.21.3</egress_optimization>
  </egress_optimization>
  <enabled type="boolean">true</enabled>
  <user_id>newusername</user_id>
  <user_password>%b5u`=8G[GfVHe`</user_password>
  <routed_remote_subnets_enabled type="boolean">false</routed_remote_subnets_enabled>
  <l2_vpn_service_id type="integer">100</l2_vpn_service_id>
  <ca_certificate_id nil="true"/>
  <created_at type="dateTime">2019-11-06T13:01:10Z</created_at>
  <updated_at type="dateTime">2019-11-06T13:01:10Z</updated_at>
</nsx_l2_vpn_peer_site>
```

Where:

- **id** - the ID of the peer site
- **label** - the name of the peer site
- **identifier** - identifier of the peer site
- **description** - the description of a peer site
- **egress_optimization** - the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel
- **enabled** - true if the newly added peer site is enabled; otherwise, false
- **user_id** - the ID of a user of a peer site
- **user_password** - the password with which the peer site is to be authenticated
- **routed_remote_subnets_enabled** - true if the sub interfaces to be stretched with the client are enabled; otherwise, false
- **l2_vpn_service_id** - the ID of the VPN service attached
- **ca_certificate_id** - the ID of the CA certificate attached
- **created_at** - the date when the peer site was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the peer site was edited in the [YYYY][MM][DD][hh][mm][ss]Z format
3.20.5.1.4 Add NSX-V L2 VPN Peer Site
To create an L2 VPN peer site, use the following request:
POST /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites.xml
POST /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites.json

XML Request Example

curl -i -X POST
http://onapp.test/nsx/edges/126/vpn/l2_vpn/service/peer_sites.xml
-H 'Accept: application/xml' -H 'Content-Type: application/xml' -d
"<nsx_l2_vpn_peer_site><description>1</description><egress_optimization type="array"><egress_optimization>123.43.21.3</egress_optimization></egress_optimization><enabled>true</enabled><l2_vpn_service_id>87</l2_vpn_service_id><label>Alpha</label><routed_remote_subnets_enabled>false</routed_remote_subnets_enabled><sub_interfaces type="array"><sub_interface>10</sub_interface><sub_interface>11</sub_interface></sub_interfaces><user_id>newusername</user_id><user_password>%b5u`8G[G#vHe`</user_password></nsx_l2_vpn_peer_site>"

JSON Request Example

curl -i -X POST
http://onapp.test/nsx/edges/113/vpn/l2_vpn/service/peer_sites.json
-H 'Accept: application/json' -H 'Content-Type: application/json' -d
"{"nsx_l2_vpn_peer_site": {"label":"New rule","description": "desc","egress_optimization": ["123.43.21.3"],"enabled": true,"user_id":"someuser","user_password":"%b5u`8G[G#vHe`","routed_remote_subnets_enabled": false,"sub_interfaces": ["10", "11"]}}"

Where:

- **label** - the label of a new peer site
- **description** - description of the peer site
- **egress_optimization** - the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel; array of IP addresses ["192.168.1.1", "192.168.1.2"] or comma-separated string("192.168.1.1, 192.168.1.2")
- **enabled** - true if the newly added peer site is enabled; otherwise, false
- **user_id** - the ID of a user with which the peer site is to be authenticated
- **user_password** - a password with which the peer site is to be authenticated
- **routed_remote_subnets_enabled** - true if the sub interfaces to be stretched with the client are enabled; otherwise, false
- **sub_interfaces** - the indexes of the sub interfaces

3.20.5.1.5 Edit NSX-V L2 VPN Peer Site
To edit L2 VPN peer service, use the following request:
PUT /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites/:peer_site_id.xml
PUT /nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites/:peer_site_id.json

XML Request Example
curl -i -X PUT
<nsx_l2_vpn_peer_site xmlns="http://schemas.vmware.com/nsx/v2"><description>1</description><egress_optimization type="array"><egress_optimization>123.43.21.3</egress_optimization></egress_optimization><enabled>true</enabled><l2_vpn_service_id>87</l2_vpn_service_id><label>Alpha</label><routed_remote_subnets_enabled>false</routed_remote_subnets_enabled><sub_interfaces type="array"><sub_interface>10</sub_interface><sub_interface>11</sub_interface></sub_interfaces><user_id>newusername</user_id><user_password>%b5u`=8G[KG#vHe`</user_password></nsx_l2_vpn_peer_site>

Where:

**label** - the label of a new peer site

**description** - description of the peer site

**egress_optimization** - the gateway IP addresses for which the traffic is to be locally routed or for which the traffic is to be blocked over the tunnel; array of IP addresses ("["192.168.1.1", "192.168.1.2"]," or comma-separated string ("192.168.1.1, 192.168.1.2")

**enabled** - true if the newly added peer site is enabled; otherwise, false

**user_id** - the ID of a user with which the peer site is to be authenticated

**user_password** - a password with which the peer site is to be authenticated

**routed_remote_subnets_enabled** - true if the sub interfaces to be stretched with the client are enabled; otherwise, false

**l2_vpn_service_id** - the ID of the VPN service associated

**sub_interfaces** - the indexes of the sub interfaces

3.20.5.1.6 Delete NSX-V L2 VPN Peer Site

To delete an L2 VPN peer site, use the following request:

DELETE
/nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites/:peer_site_id.xml

DELETE
/nsx/edges/:edge_id/vpn/l2_vpn/service/peer_sites/:peer_site_id.json

XML Request Example

```bash
```
Returns HTTP 204 response on successful deletion, or HTTP 404 when a peer site with the ID specified is not found.

3.20.5.2 NSX-V L2 VPN Client
In this section you can find the list of operations applicable for NSX managers:

- Get NSX-V L2 VPN Client Details
- Edit L2 VPN Client

3.20.5.2.1 Get NSX-V L2 VPN Client Details
To view the details of a particular L2 VPN client, use the following request:

GET /nsx/edges/:edge_id/vpn/l2_vpn/service.xml
GET /nsx/edges/:edge_id/vpn/l2_vpn/service.json

XML Request Example

```
```

JSON Request Example

```
```

XML Request Output
<nsx_l2_vpn_service>
    <id type="integer">102</id>
    <enabled type="boolean">false</enabled>
    <logging type="boolean">true</logging>
    <log_level>debug</log_level>
    <edge_id type="integer">128</edge_id>
    <routed_remote_subnets_enabled type="boolean">false</routed_remote_subnets_enabled>
    <mode>client</mode>
    <listener_ip nil="true"/>
    <listener_port nil="true"/>
    <server_address>123.3.23.3</server_address>
    <server_port type="integer">433</server_port>
    <service_certificate_id nil="true"/>
    <ca_certificate_id type="integer">217</ca_certificate_id>
    <encryption_algorithm type="array">
        <encryption_algorithm>AES128-GCM-SHA256</encryption_algorithm>
    </encryption_algorithm>
    <egress_optimization type="array">
        <egress_optimization>32.23.3.3</egress_optimization>
    </egress_optimization>
    <user_id>user</user_id>
    <user_password>@{5BChTJn`~3-="f</user_password>
    <proxy_type>https</proxy_type>
    <proxy_address>123.3.33.4</proxy_address>
    <proxy_port type="integer">433</proxy_port>
    <proxy_user_name>user</proxy_user_name>
    <proxy_user_password nil="true"/>
    <created_at type="dateTime">2019-11-06T13:01:22Z</created_at>
    <updated_at type="dateTime">2019-11-06T13:01:22Z</updated_at>
    <locked type="boolean">false</locked>
</nsx_l2_vpn_service>

Where:

id - the ID of the L2 VPN client
enabled - true if the L2 VPN service in enabled; otherwise, false
logging - true, if logging for this L2 VPN client is enabled; otherwise, false
log_level - emergency, alert, critical, error, warning, notice, info or debug
edge_id - the ID of the edge the L2 VPN client is associated with
routed_remote_subnets_enabled - true if the routed remote subnets are enabled; otherwise, false
mode - the mode of L2 VPN (server or client)
listener_ip - the primary or secondary IP address of an external interface of the NSX Edge
listener_port - the port number for the L2 VPN client
server_address - the address of the L2 VPN server to which this client is to be connected
server_port - the default port to which the L2 VPN client must connect to
service_certificate_id - the ID of the service certificate
ca_certificate_id - the ID of the CA certificate
encryption_algorithm - the encryption algorithm for communicating with the server
egress_optimization - the gateway IP address of the sub interfaces or the IP addresses to which traffic should not flow over the tunnel
user_id - a user name with which the server is to be authenticated
user_password - a password with which the peer site is to be authenticated
proxy_type - the type of traffic (TCP, HTTP, HTTPS or UDP)
proxy_address - the proxy server address
proxy_port - the proxy server port
proxy_user_name - a user name with which the proxy server is to be authenticated
proxy_user_password - a user password with which the proxy server is to be authenticated
created_at - the date when the L2 VPN client was created in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date when the L2 VPN client was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
locked - true if this L2 VPN client is locked; otherwise, false

3.20.5.2.2 Edit L2 VPN Client
To edit L2 VPN client, use the following request:
PUT /nsx/edges/:edge_id/vpn/l2_vpn/service.xml
PUT /nsx/edges/:edge_id/vpn/l2_vpn/service.json

XML Request Example

```
curl -i -X PUT http://onapp.test/nsx/edges/128/vpn/l2_vpn/service.xml -H 'Accept: application/xml' -H 'Content-Type: application/xml' -d <nsx_l2_vpn_service><ca_certificate>certificate-38</ca_certificate><certificate_auth_enabled>true</certificate_auth_enabled><egress_optimization type="array"><egress_optimization>32.23.3.3</egress_optimization></egress_optimization><encryption_algorithm type="array"><encryption_algorithm>AES128-GCM-SHA256</encryption_algorithm></encryption_algorithm><mode>client</mode><proxy_address>123.3.33.4</proxy_address><proxy_port>2722</proxy_port><proxy_user_name>user</proxy_user_name><proxy_user_password>%b5u`=8G[GV#vHe`</proxy_user_password><secure_proxy_enabled>true</secure_proxy_enabled><server_address>123.3.23.3</server_address><server_port>433</server_port><sub_interfaces type="array"><sub_interface>10</sub_interface><sub_interface>11</sub_interface></sub_interfaces><user_id>user</user_id><user_password>%b5u`=8G[GV#vHe`</user_password></nsx_l2_vpn_service>
```

JSON Request Example

```
url -i -X PUT http://onapp.test/nsx/edges/115/vpn/l2_vpn/service.json -H 'Accept: application/json' -H 'Content-Type: application/json' -d '{"nsx_l2_vpn_service":{"enabled":true,"mode":"client","server_address":"123.3.23.3","server_port":433,"encryption_algorithm":["AES128-GCM-SHA256"],"egress_optimization":["32.23.3.3"],"user_id":"user","user_password":"%b5u`=8G[GV#vHe`","proxy_address":"123.3.33.4","proxy_port":2722","proxy_user_name":"user","proxy_user_password":"%b5u`=8G[GV#vHe`","ca_certificate"="certificate-38"],"sub_interfaces":["10","11"],"certificate_auth_enabled":true,"secure_proxy_enabled":true}}'
```

Where:

enabled* - true if L2 VPN service is enabled; otherwise, false
mode* - client
server_address* - the address of the L2 VPN server to which this client is to be connected
server_port* - the default port to which the L2 VPN client must connect to
encryption_algorithm* - the encryption algorithm for communicating with the server
egress_optimization* - the gateway IP address of the sub interfaces or the IP addresses to which traffic should not flow over the tunnel
user_id* - a user name with which the server is to be authenticated
user_password* - a password with which the peer site is to be authenticated
proxy_address - the proxy server address; required if secure_proxy_enabled is true
proxy_port - the proxy server port; required if secure_proxy_enabled is true
proxy_user_name - a user name with which the proxy server is to be authenticated; required if secure_proxy_enabled is true
proxy_user_password - a user password with which the proxy server is to be authenticated; required if secure_proxy_enabled is true
ca_certificate - the identifier of the CA certificate for this client
sub_interfaces - the indexes of the sub interfaces
certificate_auth_enabled* - true if certificate client authentication is enabled; otherwise, false
secure_proxy_enabled* - true if only secure proxy connections are enabled; otherwise, false

3.20.6 NSX-V Load Balancers API

The NSX-V Edge load balancer distributes incoming service requests evenly among multiple servers in such a way that the load distribution is transparent to users. This section contains the following API requests you can use to manage NSX-V load balancers:

- Get NSX-V Load Balancer Service Details
- Edit NSX-V Load Balancer Service
- Application Profiles
- Pools
- Virtual Servers
- Service Monitors
- Application Rules

3.20.6.1 Get NSX-V Load Balancer Service Details
To get the details of the NSX-V load balancer service, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service.xml
GET /nsx/edges/:edge_id/load_balancer/service.json

XML Request Example

```bash
```

JSON Request Example

XML Output Example

```xml
<nxs-load-balancer-service>
    <id type="integer">3</id>
    <enabled type="boolean">false</enabled>
    <acceleration type="boolean">true</acceleration>
    <logging type="boolean">true</logging>
    <log_level>info</log_level>
    <edge_id type="integer">3</edge_id>
    <created_at type="date-time">2019-11-06T10:16:50Z</created_at>
    <updated_at type="date-time">2019-11-06T10:16:50Z</updated_at>
    <locked type="boolean">false</locked>
</nxs-load-balancer-service>
```

Where:

- **id** - the ID of the NSX-V load balancer service
- **enabled** - true if NSX-V load balancer service is enabled, otherwise, false
- **acceleration** - true if acceleration is enabled; otherwise, false
- **logging** - true if logging is enabled; otherwise, false
- **log_level** - emergency, alert, critical, error, warning, notice, info, or debug
- **edge_id** - the ID of the edge
- **created_at** - the date when the load balancer service was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the load balancer service was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- **locked** - true, if load balancer service is locked; otherwise, false

3.20.6.2 Edit NSX-V Load Balancer Service

To edit NSX-V load balancer service, use the following request:

**XML Request Example**

```xml
curl -i -X PUT -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url http://onapp.test/nsx/edges/3/load_balancer/service.xml -d '<nxs-load-balancer-service><enabled type="boolean">true</enabled><acceleration type="boolean">false</acceleration><logging type="boolean">false</logging><log_level>info</log_level><application_profiles type="array"><application_profile><identifier>applicationProfile-5</identifier><label>qwe</label><http_redirect_url>qwe</http_redirect_url><cookie_name>qwe</cookie_name><cipher>qwe</cipher><client_auth>required</client_auth><mode>insert</mode><persistence>sourceip</persistence><type>HTTPS</type><expires>123</expires><insert_x_forwarded type="boolean">true</insert_x_forwarded><ssl_passthrough type="boolean">true</ssl_passthrough><server_ssl
```
type="boolean">false</server_ssl><service_certificate>certificate-
52</service_certificate><ca_certificates type="array"><ca_certificate>certificate-
54</ca_certificate><crl_certificates type="array"><crl_certificate>crl-
6</crl_certificate><application_profiles><monitors type="array"><monitor><identifier>monitor-

1</identifier><label>ads</label><description>ads</description><ip_address>192.168.0.1</ip_address><port>1111</port><protocol>http</protocol><connection_limit>123</connection_limit><connection_rate_limit>1234</connection_rate_limit><enabled type="boolean">true</enabled><acceleration type="boolean">true</acceleration><application_profile>applicationProfile-
6</application_profile><default_pool>pool-
9</default_pool><application_rules type="array"><application_rule>applicationRule-
1</application_rule><application_rule>applicationRule-
2</application_rule></application_rules></virtual_server></virtual_servers>"

Where:
- **enabled** - true, if this load balancer service is enabled; otherwise, false
- **acceleration** - true, if acceleration is enabled; otherwise, false
- **logging** - true, if logging for load balancer service is enabled; otherwise, false
- **log_level** - emergency, alert, critical, error, warning, notice, info or debug

**application_profiles:**
- **identifier** - identifier of the application profile
- **label** - label of the application profile
- **http_redirect_url** - HTTP redirect URL
- **cookie_name** - Cookie's label
- **cipher** - a cipher algorithm
- **client_auth** - required or ignored
- **mode** - insert, prefix or app
- **persistence** - sourceip, msrdp, cookie or ssl_sessionid
- **type** - the type of traffic (TCP, HTTP, HTTPS or UDP)
- **expires** - the persistence expiration time in seconds. The default value is 60 seconds.
- **insert_x_forwarded** - true or false
- **ssl_passthrough** - true if SSL passthrough is enabled; otherwise, false
- **server_ssl** - true if poolside SSL is enabled; otherwise, false
- **service_certificate** - service certificate's identifier
- **ca_certificates** - CA certificates' identifiers
- **crl_certificates** - CRL certificates’ identifiers

**monitors:**
- **identifier** - identifier of the monitor
- **label** - label of the monitor
- **url** - the URL to GET or POST
- **expected** - the string that the monitor expects to match in the status line of HTTP response in the Expected section
- **send_data** - the string sent to the back-end server after a connection is established
- **receive_data** - the string to be matched
- **extension** - advanced monitor parameters as key=value pairs
- **type** - http, https, tcp, icmp or udp
- **method_data** - GET, OPTIONS or POST
- **interval** - the interval in seconds in which a server is to be tested
- **timeout** - the maximum time in seconds within which a response from the server must be received
- **max_retries** - the number of times the server is tested before it is declared DOWN

**pools:**
- **identifier** - identifier of the pool
- **label** - label of the pool
- **description** - description of the pool
- **algorithm** - round-robin, ip-hash, leastconn, uri, httpheader or url
- **transparent** - true if client IP addresses are visible to the back-end servers; otherwise, false
- **monitor** - the ID of the existing default or custom monitor
- **members** - an array of the server members with the following details:
  - **label** - the name of the server member
  - **ip_address** - the IP address of the server member
  - **monitor_port** - the monitor port where the member is to receive health monitor pings
  - **port** - the port where the member is to receive traffic
  - **enabled** - true if this member is enabled; otherwise, false
  - **weight** - the proportion of traffic this member can handle
  - **max_conn** - the maximum number of concurrent connections that the member can handle. If the incoming requests go higher than the maximum, they are queued and wait for a connection to be released.
  - **min_conn** - the minimum number of concurrent connections that a member must always accept

**application_rules:**
- **identifier** - identifier of the application rule
- **label** - label of the application rule
- **script** - application rule’s script

**virtual_servers:**
- **identifier** - identifier of the virtual server
• **label** - label of the VS
• **description** - description of the VS
• **ip_address** - IP address of the VS
• **port** - the port number that the load balancer listens on
• **protocol** - http, https, tcp or udp
• **connection_limit** - the maximum concurrent connections that the virtual server can process
• **connection_rate_limit** - the maximum incoming new connection requests per second section
• **enabled** - true if this virtual server is available for use; otherwise, false
• **acceleration** - true if acceleration is enabled for this VS; otherwise, false
• **application_profile** - the label of the application profile associated with this VS
• **default_pool** - identifier of the default pool
• **application_rules** - an array of application rules’ identifiers

### 3.20.6.3 Application Profiles

You create an application profile to define the behavior of a particular type of network traffic. After configuring a profile, you associate the profile with a virtual server. The virtual server then processes traffic according to the values specified in the profile. This section contains the following API requests:

- **Get List of Application Profiles**
- **Get Application Profile Details**
- **Add Application Profile**
- **Edit Application Profile**
- **Delete Application Profile**

#### 3.20.6.3.1 Get List of Application Profiles

To get a list of application profiles, use the following request:

GET `/nsx/edges/:edge_id/load_balancer/service/application_profiles.xml`

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**
<nsx_load_balancer_application_profiles type="array">
  <nsx_load_balancer_application_profile>
    <cipher null="true" />
    <client_auth null="true" />
    <cookie_name null="true" />
    <created_at>2019-10-03T10:31:00.000Z</created_at>
    <expires>123</expires>
    <http_redirect_url null="true" />
    <id>4</id>
    <identifier>applicationProfile-3</identifier>
    <insert_x_forwarded>false</insert_x_forwarded>
    <label>1</label>
    <load_balancer_service_id>9</load_balancer_service_id>
    <mode null="true" />
    <persistence>sourceip</persistence>
    <server_ssl>false</server_ssl>
    <ssl_passthrough>false</ssl_passthrough>
    <type>TCP</type>
    <updated_at>2019-10-03T10:31:00.000Z</updated_at>
  </nsx_load_balancer_application_profile>
</nsx_load_balancer_application_profiles>

Where:

cipher - DEFAULT, ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES256-SHA, ECDHE-ECDSA-AES256-SHA, ECDH-ECDSA-AES256-SHA, ECDH-RSA-AES256-SHA, AES256-SHA AES128-SHA, or DES-CBC3-SHA

client_auth - ignored or required

cookie_name - the Cookie's identifier

created_at - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

expires - the persistence expiration time in seconds. The default value is 60 seconds.

http_redirect_url - the HTTP redirect URL

id - the ID of the application profile

identifier - the identifier of an application profile

insert_x_forwarded - true or false

label - the label of the application profile

load_balancer_service_id - the ID of the load balancer service

mode - insert, prefix or app

persistence - sourceip, msrdp, cookie or ssl_sessionid

server_ssl - true if poolside SSL is enabled; otherwise, false

ssl_passthrough - true if SSL passthrough is enabled; otherwise, false

type - the type of traffic (TCP, HTTP, HTTPS or UDP)

updated_at - the date when the application profile was updated in the [YYYY][MM][DD][T][hh][mm][ss]Z format

3.20.6.3.2 Get Application Profile Details

To get details of a particular application profile, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service/application_profiles/:application_profile_id.xml

GET
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

/nsx/edges/:edge_id/load_balancer/service/application_profiles/:application_profile_id.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```
<nsx_load_balancer_application_profile>
  <cipher>DEFAULT</cipher>
  <client_auth>required</client_auth>
  <cookie_name null="true" />
  <created_at>2019-10-04T08:17:34.000Z</created_at>
  <expires>123</expires>
  <http_redirect_url null="true" />
  <id>4</id>
  <identifier>applicationProfile-3</identifier>
  <insert_x_forwarded>true</insert_x_forwarded>
  <label>1111</label>
  <load_balancer_service_id>9</load_balancer_service_id>
  <mode null="true" />
  <persistence>sourceip</persistence>
  <server_ssl>true</server_ssl>
  <ssl_passthrough>false</ssl_passthrough>
  <type>HTTPS</type>
  <updated_at>2019-10-04T08:17:34.000Z</updated_at>
</nsx_load_balancer_application_profile>
```

**Where:**

- **cipher** - DEFAULT, ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES256-SHA, ECDHE-ECDSA-AES256-SHA, ECDH-ECDSA-AES256-SHA, ECDH-RSA-AES256-SHA, AES256-SHA AES128-SHA, or DES-CBC3-SHA

- **client_auth** - whether client authentication is required or ignored

- **cookie_name** - true for the Cookie persistence type; otherwise, false

- **created_at** - the date when the application profile was created in the [YYYY][MM][DD][hh][mm][ss][Z] format

- **expires** - the persistence expiration time in seconds. The default value is 60 seconds.

- **http_redirect_url** - true for HTTP or HTTPs type of traffic; false for TCP or UDP

- **id** - the ID of an application profile

- **identifier** - the identifier of an application profile

- **insert_x_forwarded** - true or false
**label** - the label of a load balancer

**load_balancer_service_id** - the ID of the load balancer service

**mode** - true for Cookie persistence type; otherwise, false

**persistence** - the persistence type (sourceip, cookie or none)

**server_ssl** - true if poolside SSL is enabled; otherwise, false

**ssl_passthrough** - true if SSL passthrough is enabled; otherwise, false

**type** - the type of traffic (TCP, HTTP, HTTPS or UDP)

**updated_at** - the date when the application profile was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

### 3.20.6.3.3 Add Application Profile

To create an application profile, use the following request:

**POST**

/nsx/edges/:edge_id/load_balancer/service/application_profiles.xml

**POST**

/nsx/edges/:edge_id/load_balancer/service/application_profiles.json

#### XML Request Example

```
curl -i -X POST -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url http://onapp.test/nsx/edges/3/load_balancer/service/application_profiles.xml -d '<nsx_application_profile><label>new</label><cipher>DEFAULT</cipher><client_auth>required</client_auth><persistence>sourceip</persistence><type>HTTP</type><expires type="integer">123</expires><insert_x_forwarded type="boolean">true</insert_x_forwarded><ssl_passthrough type="boolean">false</ssl_passthrough><server_ssl type="boolean">true</server_ssl><ca_certificates type="array"><ca_certificate>certificate-52</ca_certificate></ca_certificates><crl_certificates type="array"><crl_certificate>crl-4</crl_certificate><crl_certificate>crl-6</crl_certificate></crl_certificates><service_certificate>certificate-54</service_certificate></nsx_application_profile>"
```

#### JSON Request Example

```
```

**Where:**

**label** - the label of an application profile

**cipher** - DEFAULT, ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES256-SHA, ECDHE-ECDSA-AES256-SHA, ECDH-ECDSA-AES256-SHA, ECDH-RSA-AES256-SHA, AES256-SHA AES128-SHA, or DES-CBC3-SHA

**client_auth** - select whether to ignore or accept client authentication (ignore or required)

**persistence** - the persistence type (sourceip, cookie or none)
type - the type of traffic (TCP, HTTP, HTTPS or UDP)

expires - the persistence expiration time in seconds. The default value is 60 seconds.

insert_x_forwarded - true or false

ssl_passthrough - true if SSL passthrough is enabled; otherwise, false

server_ssl - true if poolside SSL is enabled; otherwise, false

certificate - CA certificates' identifiers

crl_certificates - CRL certificates' identifiers

service_certificate - server certificates to authenticate the load balancer from the server side

3.20.6.3.4 Edit Application Profile

To edit a particular application profile, use the following request:

PUT /nsx/edges/:edge_id/load_balancer/service/application_profiles/:application_profile_id.xml

PUT /nsx/edges/:edge_id/load_balancer/service/application_profiles/:application_profile_id.json

XML Request Example

<nsx_application_profile> <label>new</label> <cipher>DEFAULT</cipher> <client_auth>required</client_auth> <persistence>sourceip</persistence> <type>HTTP</type> <expires type="integer">123</expires> <insert_x_forwarded type="boolean">true</insert_x_forwarded> <ssl_passthrough type="boolean">false</ssl_passthrough> <server_ssl type="boolean">true</server_ssl> <ca_certificates> <ca_certificate> certificate-52 </ca_certificate> </ca_certificates> <crl_certificates> <crl_certificate>crl-4</crl_certificate> </crl_certificates> <service_certificate> certificate-54 </service_certificate> </nsx_application_profile>"

JSON Request Example

Where:

label - label of the application profile

cipher - DEFAULT, ECDHE-RSA-AES128-GCM-SHA256, ECDHE-RSA-AES256-GCM-SHA384, ECDHE-RSA-AES256-SHA, ECDHE-ECDSA-AES256-SHA, ECDH-ECDSA-AES256-SHA, ECDH-RSA-AES256-SHA, AES256-SHA AES128-SHA, or DES-CBC3-SHA

client_auth - select whether to ignore or accept client authentication (ignore or required)
persistence - the persistence type (sourceip, cookie or none)
type - the type of traffic (TCP, HTTP, HTTPS or UDP)
expires - the persistence expiration time in seconds. The default value is 60 seconds.
insert_x_forwarded - true or false
ssl_passthrough - true if SSL passthrough is enabled; otherwise, false
server_ssl - true if poolside SSL is enabled; otherwise, false
ca_certificates - CA certificates' identifiers
crl_certificates - CRL certificates' identifiers
service_certificate - server certificate's identifier to authenticate the load balancer from the server side

3.20.6.3.5 Delete Application Profile
To delete an application profile, use the following request:

DELETE
/nsx/edges/:edge_id/load_balancer/service/application_profiles/:service_application_id.xml
DELETE
/nsx/edges/:edge_id/load_balancer/service/application_profiles/:service_application_id.json

XML Request Example

```
curl -I -X DELETE -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --
url http://onapp.test/nsx/edges/3/load_balancer/service/application_profiles/6.xml
```

JSON Request Example

```
curl -I -X DELETE -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --
url http://onapp.test/nsx/edges/3/load_balancer/service/application_profiles/6.json
```

Returns HTTP 204 response on successful deletion, or HTTP 404 when an application profile with the ID specified is not found.

3.20.6.4 Pools
After you add a server pool to manage load balancer distribution, you can update the existing pool or delete it to save system resources. The following API requests are applicable for NSX-V load balancer virtual server pools:

- Get List of Pools
- Get Pool Details
- Add Pool
- Edit Pool
- Delete Pool
3.20.6.4.1 Get List of Pools
To view a list of the pools, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service/pools.xml
GET /nsx/edges/:edge_id/load_balancer/service/pools.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example

```
<nsx_load_balancer_pools type="array">
  <nsx_load_balancer_pool>
    <algorithm>ip-hash</algorithm>
    <algorithm_params null="true" />
    <created_at>2019-10-07T09:45:07.000Z</created_at>
    <description>2</description>
    <id>2</id>
    <identifier>pool-6</identifier>
    <label>p2</label>
    <load_balancer_service_id>9</load_balancer_service_id>
    <monitor_id>26</monitor_id>
    <transparent>false</transparent>
    <updated_at>2019-10-07T09:45:07.000Z</updated_at>
  </nsx_load_balancer_pool>
  ...
</nsx_load_balancer_pools>
```

Where:

- **algorithm** - round-robin, ip-hash, leastconn, uri, httpheader or url
- **algorithm_params** - algorithm parameters for httpheader, url
- **created_at** - the date when the VS pool was created in the [YYYY][MM][DD][T][hh][mm][ss]Z format
- **description** - the description of the VS pool
- **id** - the edge gateway ID
- **identifier** - the identifier of the pool
- **label** - the label of the pool
- **load_balancer_service_id** - the ID of the load balancer service
- **monitor_id** - the ID of the default or custom monitor
- **transparent** - true if client IP addresses are visible to the back-end servers; otherwise, false
- **updated_at** - the date when the VS pool was created in the [YYYY][MM][DD][T][hh][mm][ss]Z format
3.20.6.4.2  Get Pool Details
To view the details of a particular pool, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service/pools/:pool_id.xml
GET /nsx/edges/:edge_id/load_balancer/service/pools/:pool_id.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example

```
<nsx_load_balancer_pool>
  <algorithm>ip-hash</algorithm>
  <algorithm_params null="true" />
  <created_at>2019-10-07T09:45:07.000Z</created_at>
  <description>2</description>
  <id>2</id>
  <identifier>pool-6</identifier>
  <label>p2</label>
  <load_balancer_service_id>9</load_balancer_service_id>
  <monitor_id>26</monitor_id>
  <transparent>false</transparent>
  <updated_at>2019-10-07T09:45:07.000Z</updated_at>
</nsx_load_balancer_pool>
```

Where:
- **algorithm** - round-robin, ip-hash, leastconn, uri, httpheader or url
- **algorithm_params** - algorithm parameters for httpheader, url
- **created_at** - the date when the VS pool was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **description** - the description of the VS pool
- **id** - the edge gateway ID
- **identifier** - the identifier of the VS pool
- **label** - the label of the VS pool
- **load_balancer_service_id** - the ID of the load balancer service
- **monitor_id** - the ID of the default or custom monitor
- **transparent** - true if client IP addresses are visible to the back-end servers; otherwise, false
- **updated_at** - the date when the VS pool was created in the [YYYY][MM][DD][hh][mm][ss]Z format

3.20.6.4.3  Add Pool
To create a pool, use the following request:
POST /nsx/edges/:edge_id/load_balancer/service/pools.xml
POST /nsx/edges/:edge_id/load_balancer/service/pools.json

**XML Request Example**

```
```

**JSON Request Example**

```
curl -i -X POST -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --url http://onapp.test/nsx/edges/9/load_balancer/service/pools.json -d '{"nsx_pool": {"label": "ads","description": "ads","algorithm": "ip-hash","transparent": "true","monitor": "monitor-2","members": [{"label": "ads","ip_address": "192.168.0.1","monitor_port": "1111","port": "2222","enabled": "true","weight": "1","max_conn": "3","min_conn": "4"}]}}'
```

**Where:**
- **label** - the label of the VS pool
- **description** - the description of the VS pool
- **algorithm** - round-robin, ip-hash, leastconn, uri, httpheader or url
- **transparent** - true if client IP addresses are visible to the back-end servers; otherwise, false
- **monitor** - the identifier of the existing default or custom monitor
- **members** - an array of the server members with the following details:
  - **label** - the name of the server member
  - **ip_address** - the IP address of the server member
  - **monitor_port** - the monitor port where the member is to receive health monitor pings
  - **port** - the port where the member is to receive traffic
  - **enabled** - true if this member is enabled; otherwise, false
  - **weight** - the proportion of traffic this member can handle
  - **max_conn** - the maximum number of concurrent connections that the member can handle. If the incoming requests go higher than the maximum, they are queued and wait for a connection to be released.
  - **min_conn** - the minimum number of concurrent connections that a member must always accept

3.20.6.4.4 Edit Pool

To edit a particular pool, use the following request:

PUT /nsx/edges/:edge_id/load_balancer/service/pools/:pool_id.xml
PUT /nsx/edges/:edge_id/load_balancer/service/pools/:pool_id.json

**XML Request Example**

**JSON Request Example**

**Where:**

- **label** - the label of the pool
- **description** - the description of the pool
- **algorithm** - round-robin, ip-hash, leastconn, uri, httpheader or url
- **algorithm_params** - algorithm parameters for httpheader, url
- **transparent** - set to 1 to make client IP addresses visible to the back-end servers
- **monitor** - the identifier of the service monitor

**Optional parameters:**

- **members** - an array of the server members with the following parameters:
  - **enabled** - set to 1 to enable load balancers service
  - **ip_address** - the IP address of the server member
  - **label** - a name of the server member
  - **max_conn** - enter the maximum number of concurrent connections that the member can handle. If the incoming requests go higher than the maximum, they are queued and wait for a connection to be released.
  - **min_conn** - enter the minimum number of concurrent connections that a member must always accept
  - **port** - enter the monitor port where the member is to receive health monitor pings
  - **weight** - enter the proportion of traffic this member can handle

3.20.6.4.5 Delete Pool

To delete a pool, use the following request:

DELETE /nsx/edge/:edge_id/load_balancer/service/pools/:pool_id.xml
DELETE /nsx/edge/:edge_id/load_balancer/service/pools/:pool_id.json

**XML Request Example**
Returns HTTP 204 response on successful deletion, or HTTP 404 when a pool with the ID specified is not found.

3.20.6.5 Virtual Servers
After you add virtual servers, you can update the existing virtual server configuration or delete it. This section contains the following API requests:

- Get List of Virtual Servers
- Get Virtual Server Details
- Add Virtual Server
- Edit Virtual Server
- Delete Virtual Server

3.20.6.5.1 Get List of Virtual Servers
To view the list of virtual servers, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service/virtual_servers.xml
GET /nsx/edges/:edge_id/load_balancer/service/virtual_servers.json

XML Request Example

```bash
```

JSON Request Example

```bash
```

XML Output Example
<nsx_load_balancer_virtual_servers type="array">
  <nsx_load_balancer_virtual_server>
    <id type="integer">6</id>
    <identifier>virtualServer-24</identifier>
    <label>vsi</label>
    <description nil="true"/>
    <ip_address>69.168.237.214</ip_address>
    <port>222</port>
    <protocol>tcp</protocol>
    <connection_limit type="integer">0</connection_limit>
    <connection_rate_limit type="integer">0</connection_rate_limit>
    <enabled type="boolean">false</enabled>
    <acceleration type="boolean">false</acceleration>
    <default_pool_id type="integer">2</default_pool_id>
    <load_balancer_service_id type="integer">3</load_balancer_service_id>
    <created_at type="dateTime">2019-11-07T11:44:20Z</created_at>
    <updated_at type="dateTime">2019-11-07T11:44:20Z</updated_at>
    <application_profile_id type="integer">6</application_profile_id>
  </nsx_load_balancer_virtual_server>
  ...
</nsx_load_balancer_virtual_servers>

Where:

- **id** - the ID of the virtual server
- **identifier** - the identifier of the VS
- **label** - the name of a virtual server
- **description** - the description of the VS
- **ip_address** - an IP address that the load balancer is listening on
- **port** - the port number that the load balancer listens on
- **protocol** - http, https, tcp or udp
- **connection_limit** - the maximum concurrent connections that the virtual server can process
- **connection_rate_limit** - the maximum incoming new connection requests per second section
- **enabled** - true if this virtual server is available for use; otherwise, false
- **acceleration** - true if acceleration is enabled for this VS; otherwise, false
- **default_pool_id** - the identifier of the default VSs pool
- **load_balancer_service_id** - the ID of the load balancer service
- **created_at** - the date when the VS was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the VS was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- **application_profile_id** - the ID of the application profile associated with this VS

3.20.6.5.2 Get Virtual Server Details

To view the details of a particular virtual server, use the following request:

GET
/nsx/edges/:edge_id/load_balancer/service/virtual_servers/:virtual_server_id.xml
GET
/nsx/edges/:edge_id/load_balancer/service/virtual_servers/:virtual_server_id.json

XML Request Example

JSON Request Example

XML Output Example

```xml
<nsx_load_balancer_virtual_server>
  <id type="integer">6</id>
  <identifier>virtualServer-24</identifier>
  <label>vsl</label>
  <description nil="true"/>
  <ip_address>69.168.237.214</ip_address>
  <port>222</port>
  <protocol>tcp</protocol>
  <connection_limit type="integer">0</connection_limit>
  <connection_rate_limit type="integer">0</connection_rate_limit>
  <enabled type="boolean">false</enabled>
  <acceleration type="boolean">false</acceleration>
  <default_pool_id type="integer">2</default_pool_id>
  <load_balancer_service_id type="integer">3</load_balancer_service_id>
  <created_at type="dateTime">2019-11-07T11:44:20Z</created_at>
  <updated_at type="dateTime">2019-11-07T11:44:20Z</updated_at>
  <application_profile_id type="integer">6</application_profile_id>
</nsx_load_balancer_virtual_server>
```

Where:

- **id** - ID of the VS
- **identifier** - the identifier of the VS
- **label** - the name of a virtual server
- **description** - the description of the VS
- **ip_address** - an IP address that the load balancer is listening on
- **port** - the port number that the load balancer listens on
- **protocol** - http, https, tcp or udp
- **connection_limit** - the maximum concurrent connections that the virtual server can process
- **connection_rate_limit** - the maximum incoming new connection requests per second section
- **enabled** - true if this virtual server is available for use; otherwise, false
- **acceleration** - true if acceleration is enabled for this VS; otherwise, false
- **default_pool_id** - the ID of the default VSs pool
- **load_balancer_service_id** - the identifier of the load balancer service
- **created_at** - the date when the VS was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the VS was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- **application_profile_id** - the ID of the application profile associated with this VS
3.20.6.5.3 Add Virtual Server
To create a virtual server, use the following request:

POST /nsx/edges/:edge_id/load_balancer/service/virtual_servers.xml
POST /nsx/edges/:edge_id/load_balancer/service/virtual_servers.json

XML Request Example

```
curl -i -X POST -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d '
  <nsx_virtual_server>
    <label>New</label>
    <description>New</description>
    <ip_address>10.0.0.138</ip_address>
    <port>4321</port>
    <protocol>tcp</protocol>
    <connection_limit>1</connection_limit>
    <connection_rate_limit>2</connection_rate_limit>
    <enabled>true</enabled>
    <acceleration>false</acceleration>
    <application_profile>applicationProfile-3</application_profile>
    <default_pool>pool-7</default_pool>
  </nsx_virtual_server>
```

JSON Request Example

```
curl -i -X POST -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '
  {"nsx_virtual_server": {
    "label": "New",
    "description": "New",
    "ip_address": "10.0.0.138",
    "port": "4321",
    "protocol": "tcp",
    "connection_limit": "1",
    "connection_rate_limit": "2",
    "enabled": true,
    "acceleration": false,
    "application_profile": "applicationProfile-3",
    "default_pool": "pool-7",
    "application_rules": [
      "applicationRule-1",
      "applicationRule-2"
    ]
  }}
```

Where:

- **label** - the name of a virtual server
- **description** - the description of the VS
- **ip_address** - an IP address that the load balancer is listening on
- **port** - the port number that the load balancer listens on
- **protocol** - http, https, tcp or udp
- **connection_limit** - the maximum concurrent connections that the virtual server can process
- **connection_rate_limit** - the maximum incoming new connection requests per second section
- **enabled** - true if this virtual server is available for use; otherwise, false
- **acceleration** - true if acceleration is enabled for this VS; otherwise, false
- **application_profile** - the label of the application profile associated with this VS
- **default_pool** - identifier of the default pool
- **application_rules** - an array of application rules associated with the virtual server

3.20.6.5.4 Edit Virtual Server
To edit virtual servers, use the following request:

PUT
/nsx/edges/:edge_id/load_balancer/service/virtual_servers/:virtual_server_id.xml
PUT
/nsx/edges/:edge_id/load_balancer/service/virtual_servers/:virtual_server_id.json

XML Request Example

```
curl -i -X PUT -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -url
http://onapp.test/nsx/edges/9/load_balancer/service/virtual_servers/6.xml
-d '<nsx_virtual_server><label>New</label><description>New</description><ip_address>10.0.0.138</ip_address><port>4321</port><protocol>tcp</protocol><connection_limit>1</connection_limit><connection_rate_limit>2</connection_rate_limit><enabled type="boolean">true</enabled><acceleration type="boolean">false</acceleration><application_profile>applicationProfile-3</application_profile><default_pool>pool-7</default_pool><application_rules type="array"></application_rules></nsx_virtual_server>'
```

JSON Request Example

```
curl -i -X PUT -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -url
http://onapp.test/nsx/edges/9/load_balancer/service/virtual_servers/6.json
-d '{"nsx_virtual_server": {"label": "NEWEST","description": "New","ip_address": "10.0.0.138","port": "4321","protocol": "tcp","connection_limit": "1","connection_rate_limit": "2","enabled": "1","acceleration": "0","application_profile": "applicationProfile-3","default_pool": "pool-7","application_rules": []}}'
```

Where:

- **label** - the name of a virtual server
- **description** - the description of the VS
- **ip_address** - an IP address that the load balancer is listening on
- **port** - the port number that the load balancer listens on
- **protocol** - http, https, tcp or udp
- **connection_limit** - the maximum concurrent connections that the virtual server can process
- **connection_rate_limit** - the maximum incoming new connection requests per second section
- **enabled** - true, if this virtual server is available for use; otherwise, false
- **acceleration** - true, if acceleration is enabled for this VS; otherwise, false
- **application_profile** - the label of the application profile associated with this VS
- **default_pool** - the identifier of the default pool
- **application_rules** - an array of application rules associated with the virtual server

3.20.6.5.5 Delete Virtual Server

To delete a virtual server, use the following request:

DELETE
/nsx/edges/:edge_id/load_balancer/service/virtual_servers/:virtual_server_id.xml
DELETE
/nsx/edges/:edge_id/load_balancer/service/virtual_servers/:virtual_server_id.json
XML Request Example

```
curl -i -X DELETE -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -
```

JSON Request Example

```
curl -i -X DELETE -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -
```

Returns HTTP 204 response on successful deletion, or HTTP 404 when a VS with the ID specified is not found.

3.20.6.6 Service Monitors
A service monitor defines health check parameters for the load balancer. After you create a service monitor and associate it with a server pool, you can update the existing service monitor or delete it to save system resources. Below you can find the list of operations applicable for NSX-V service monitors:

- Get List of Service Monitors
- Get Service Monitor Details
- Add Service Monitor
- Edit Service Monitor
- Delete Service Monitor

3.20.6.6.1 Get List of Service Monitors
To get the list of service monitors, use the following request:
GET /nsx/edges/:edge_id/load_balancer/service/monitors.xml
GET /nsx/edges/:edge_id/load_balancer/service/monitors.json

XML Request Example

```
curl -i -X GET -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -
url http://onapp.test/nsx/edges/3/load_balancer/service/monitors.xml
```

JSON Request Example

```
curl -i -X GET -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -
url http://onapp.test/nsx/edges/3/load_balancer/service/monitors.json
```

XML Output Example
<nsx_load_balancer_monitors type="array">
  <nsx_load_balancer_monitor>
    <id type="integer">2</id>
    <identifier>monitor-1</identifier>
    <label>default_tcp_monitor</label>
    <url nil="true"/>
    <expected nil="true"/>
    <send_data nil="true"/>
    <receive_data nil="true"/>
    <type>tcp</type>
    <method_data nil="true"/>
    <interval type="integer">5</interval>
    <timeout type="integer">15</timeout>
    <max_retries type="integer">3</max_retries>
    <load_balancer_service_id type="integer">3</load_balancer_service_id>
    <created_at type="dateTime">2019-11-06T10:16:50Z</created_at>
    <updated_at type="dateTime">2019-11-06T10:16:50Z</updated_at>
  </nsx_load_balancer_monitor>
  <nsx_load_balancer_monitor>
    <id type="integer">9</id>
    <identifier>monitor-5</identifier>
    <label>m1</label>
    <url>/</url>
    <expected nil="true"/>
    <send_data>qwe</send_data>
    <receive_data>qwe</receive_data>
    <extension nil="true"/>
    <type>http</type>
    <method_data>GET</method_data>
    <interval type="integer">0</interval>
    <timeout type="integer">0</timeout>
    <max_retries type="integer">0</max_retries>
    <load_balancer_service_id type="integer">3</load_balancer_service_id>
    <created_at type="dateTime">2019-11-06T10:16:50Z</created_at>
    <updated_at type="dateTime">2019-11-06T10:16:50Z</updated_at>
  </nsx_load_balancer_monitor>
</nsx_load_balancer_monitors>

Where:

id - ID of the service monitor
identifier - identifier of the service monitor
label - label of the service monitor
url - the URL to GET or POST
expected - the string that the monitor expects to match in the status line of HTTP response in the Expected section
send_data - the string sent to the back-end server after a connection is established
receive_data - the string to be matched
extension - advanced monitor parameters as key=value pairs
type - http, https, tcp, icmp or udp
method_data - GET, OPTIONS or POST
interval - the interval in seconds in which a server is to be tested
timeout - the maximum time in seconds within which a response from the server must be received
max_retries - the number of times the server is tested before it is declared DOWN

load_balancer_service_id - ID of the load balancer service

created_at - the date when the service monitor was created in the [YYYY][MM][DD]T[hh][mm][ss]Z format

updated_at - the date when the service monitor was updated in the [YYYY][MM][DD]T[hh][mm][ss]Z format

3.20.6.6.2 Get Service Monitor Details
To get service monitor details, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service/monitors/:monitor_id.xml
GET /nsx/edges/:edge_id/load_balancer/service/monitors/:monitor_id.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example

```
<nsx_load_balancer_monitor>
  <id type="integer">9</id>
  <identifier>monitor-5</identifier>
  <label>m1</label>
  <url></url>
  <expected nil="true"/>
  <send_data>qwe</send_data>
  <receive_data>qwe</receive_data>
  <extension nil="true"/>
  <type>http</type>
  <method_data>GET</method_data>
  <interval type="integer">0</interval>
  <timeout type="integer">0</timeout>
  <max_retries type="integer">0</max_retries>
  <load_balancer_service_id type="integer">3</load_balancer_service_id>
  <created_at type="dateTime">2019-11-06T16:50Z</created_at>
  <updated_at type="dateTime">2019-11-06T16:50Z</updated_at>
</nsx_load_balancer_monitor>
```

Where:

id - ID of the service monitor

identifier - identifier of the service monitor

label - label of the service monitor

url - the URL to GET or POST
expected - the string that the monitor expects to match in the status line of HTTP response in the Expected section

send_data - the string sent to the back-end server after a connection is established

receive_data - the string to be matched

extension - advanced monitor parameters as key=value pairs

type - http, https, tcp, icmp or udp

method_data - GET, OPTIONS or POST

interval - the interval in seconds in which a server is to be tested

timeout - the maximum time in seconds within which a response from the server must be received

max_retries - the number of times the server is tested before it is declared DOWN

load_balancer_service_id - ID of the load balancer service

created_at - the date when the service monitor was created in the [YYYY][MM][DD]T[hh][mm][ss]Z format

updated_at - the date when the service monitor was updated in the [YYYY][MM][DD]T[hh][mm][ss]Z format

3.20.6.6.3 Add Service Monitor

To add a service monitor, use the following request:

POST /nsx/edges/:edge_id/load_balancer/service/monitors.xml

POST /nsx/edges/:edge_id/load_balancer/service/monitors.json

XML Request Example

JSON Request Example

Where:

label - label of the service monitor

interval - the interval in seconds in which a server is to be tested

timeout - the maximum time in seconds within which a response from the server must be received

max_retries - the number of times the server is tested before it is declared DOWN
type - http, https, tcp, icmp or udp

method_data - GET, OPTIONS or POST

url - the URL to GET or POST

evented - the string that the monitor expects to match in the status line of HTTP response in the Expected section

send_data - the string sent to the back-end server after a connection is established

receive_data - the string to be matched

extension - advanced monitor parameters as key=value pairs

3.20.6.4 Edit Service Monitor

To edit a service monitor, use the following request:

PUT /nsx/edges/:edge_id/load_balancer/service/monitors/:monitor_id.xml

XML Request Example

JSON Request Example

Where:

label - label of the service monitor

interval - the interval in seconds in which a server is to be tested

timeout - the maximum time in seconds within which a response from the server must be received

max_retries - the number of times the server is tested before it is declared DOWN

type - http, tcp, icmp or udp

method_data - GET, OPTIONS or POST

url - the URL to GET or POST

expected - the string that the monitor expects to match in the status line of HTTP response in the Expected section

send_data - the string sent to the back-end server after a connection is established
receive_data - the string to be matched

text extension - advanced monitor parameters as key=value pairs

3.20.6.6.5 Delete Service Monitor
To delete a service monitor, use the following request:

DELETE /nsx/edges/:edge_id/load_balancer/service/monitors/:monitor_id.

XML Request Example

```bash
curl -i -X DELETE -u user:userpass
-H 'Accept: application/xml' -H 'Content-type: application/xml'
```

JSON Request Example

```bash
curl -i -X DELETE -u user:userpass
-H 'Accept: application/json' -H 'Content-type: application/json'
```

Returns HTTP 204 response on successful deletion, or HTTP 404 when a service monitor with the ID specified is not found.

3.20.6.7 Application Rules
You can write an application rule to directly manipulate and manage application traffic. Below you can find the list of operations for application rules:

- Get List of Application Rules
- Get Application Rule Details
- Add Application Rule
- Edit Application Rule
- Delete Application Rule

3.20.6.7.1 Get List of Application Rules
To get the list of application rules, use the following request:

GET /nsx/edges/:edge_id/load_balancer/service/application_rules.xml
GET /nsx/edges/:edge_id/load_balancer/service/application_rules.json

XML Request Example

```bash
curl -i -X GET -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url
http://onapp.test/nsx/edges/3/load_balancer/service/application_rules.xml
```

JSON Request Example

```bash
curl -i -X GET -u user:userpass --url
http://onapp.test/nsx/edges/3/load_balancer/service/application_rules.json
```

XML Output Example

<nsx_load_balancer_application_rules type="array">
  <nsx_load_balancer_application_rule>
    <id type="integer">3</id>
    <identifier>applicationRule-1</identifier>
    <label>ar1</label>
    <script>acl block_ACME path_beg -i /cloud/org/acme block if block_ACME</script>
    <load_balancer_service_id type="integer">3</load_balancer_service_id>
    <created_at type="dateTime">2019-11-06T10:16:58Z</created_at>
    <updated_at type="dateTime">2019-11-06T10:16:58Z</updated_at>
  </nsx_load_balancer_application_rule>
  <nsx_load_balancer_application_rule>
    <id type="integer">4</id>
    <identifier>applicationRule-2</identifier>
    <label>ar2</label>
    <script>acl block_ACME path_beg -i /cloud/org/acme</script>
    <load_balancer_service_id type="integer">3</load_balancer_service_id>
    <created_at type="dateTime">2019-11-06T10:16:58Z</created_at>
    <updated_at type="dateTime">2019-11-06T10:16:58Z</updated_at>
  </nsx_load_balancer_application_rule>
</nsx_load_balancer_application_rules>

Where:

id - ID of the application rule
identifier - identifier of the application rule
label - label of the application rule
script - script of the application rule
load_balancer_service_id - ID of the load balancer service
created_at - the date when the firewall rule was created in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date when the firewall rule was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

3.20.6.7.2 Get Application Rule Details
To get the details of an application rule, use the following request

GET /nsx/edges/:edge_id/load_balancer/service/application_rules/:rule_id.xml
GET /nsx/edges/:edge_id/load_balancer/service/application_rules/:rule_id.json

XML Request Example
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

JSON Request Example

XML Output Example

```xml
<nvx_load_balancer_application_rule>
  <id type="integer">4</id>
  <identifier>applicationRule-2</identifier>
  <label>ar2</label>
  <script>acl block ACME path_beg -i /cloud/org/acme</script>
  <load_balancer_service_id type="integer">3</load_balancer_service_id>
  <created_at type="dateTime">2019-11-06T10:16:58Z</created_at>
  <updated_at type="dateTime">2019-11-06T10:16:58Z</updated_at>
</nvx_load_balancer_application_rule>
```

Where:

- **id**: ID of the application rule
- **identifier**: identifier of the application rule
- **label**: label of the application rule
- **script**: script of the application rule
- **load_balancer_service_id**: ID of the load balancer service
- **created_at**: the date when the firewall rule was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at**: the date when the firewall rule was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

3.20.6.7.3 Add Application Rule

To add a new application rule, use the following request:

POST /nsx/edges/:edge_id/load_balancer/service/application_rules.xml

POST /nsx/edges/:edge_id/load_balancer/service/application_rules.json

XML Request Example

JSON Request Example

Where:

* label - label of the application rule
* script - application rule script

3.20.6.7.4 Edit Application Rule
To edit an application rule, use the following request:

PUT /nsx/edges/:edge_id/load_balancer/service/application_rules/:rule_id.xml
PUT /nsx/edges/:edge_id/load_balancer/service/application_rules/:rule_id.json

XML Request Example

JSON Request Example

Where:

* label - label of the application rule
* script - application rule script

3.20.6.7.5 Delete Application Rule
To delete an application rule, use the following request:

DELETE /nsx/edges/:edge_id/load_balancer/service/application_rules/:rule_id.xml
DELETE /nsx/edges/:edge_id/load_balancer/service/application_rules/:rule_id.json

XML Request Example

curl -i -X DELETE -u user:userpass

JSON Request Example
Returns HTTP 204 response on successful deletion, or HTTP 404 when an application rule with the ID specified is not found.

3.20.7 NSX Managers API

The NSX manager is used to deploy a universal controller cluster that provides the control plane for the NSX-V environment. At OnApp, you can import NSX manager with limited functionality available and set vCloud credentials to gain access to full functionality. Once imported, it allows you to view and edit imported vCloud edge gateways in OnApp interface.

Below you can find the list of operations applicable for NSX managers:

- Get List of NSX Managers
- Get NSX Manager Details
- Import NSX Manager
- Update NSX Manager Credentials

3.20.7.1 Get List of NSX Managers

To get the list of NSX managers in your cloud, use the following request:

GET /settings/nsx/managers.xml
GET /settings/nsx/managers.json

XML Request Example

```
```

JSON Request Example

```
```

XML Output Example
<nsx_managers type="array">
    <nsx_manager>
        <id type="integer">1</id>
        <label>NSX manager for vc-c.onappdev.host</label>
        <api_url>https://nsx-c.onappdev.host:443</api_url>
        <login>admin</login>
        <password>password1</password>
        <vcenter_type>Nsx::VCloud::VCenter</vcenter_type>
        <vcenter_id type="integer">1</vcenter_id>
        <created_at type="dateTime">2019-11-11T08:00:51Z</created_at>
        <updated_at type="dateTime">2019-11-11T08:28:36Z</updated_at>
        <version>6.4.5 Build 13282012</version>
        <host>nsx-c.onappdev.host</host>
        <status>RUNNING</status>
        <uptime>8 days, 16 hours, 33 minutes</uptime>
    </nsx_manager>
    <nsx_manager>
        <id type="integer">2</id>
        <label>NSX manager for vc-d.onappdev.host</label>
        <api_url>https://nsx-d.onappdev.host:443</api_url>
        <login>admin</login>
        <password nil="true"/>
        <vcenter_type>Nsx::VCloud::VCenter</vcenter_type>
        <vcenter_id type="integer">2</vcenter_id>
        <created_at type="dateTime">2019-11-11T08:00:52Z</created_at>
        <updated_at type="dateTime">2019-11-11T08:00:52Z</updated_at>
        <host nil="true"/>
        <status nil="true"/>
        <uptime nil="true"/>
    </nsx_manager>
</nsx_managers>

Where:

- id - the ID of the NSX manager
- label - the label of the NSX manager
- api_url - the URL used to connect to NSX-V
- login - login of the NSX manager
- password - password of the NSX manager
- vcenter_type - Nsx::VCloud::VCenter or Nsx::Hypervisor
- vcenter_id - ID of the vCenter VS
- created_at - the date when the NSX manager was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- updated_at - the date when the NSX manager was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- version - NSX-V version
- host - hostname of the vCenter VS
- status - STARTING, RUNNING, STOPPING, or STOPPED
- uptime - duration of the uptime

Page History

v.6.3 Edge 1
3.20.7.2 Get NSX Manager Details

To get an NSX manager details, use the following request:

GET /settings/nsx/managers/:manager_id.xml
GET /settings/nsx/managers/:manager_id.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```
<nsx_manager>  
  <id type="integer">1</id>  
  <label>NSX manager for vc-c.onappdev.lviv</label>  
  <api_url>https://nsx-c.onappdev.lviv:443</api_url>  
  <login>admin</login>  
  <password>P@ssword1!</password>  
  <vcenter_type>Nsx::VCloud::VCenter</vcenter_type>  
  <vcenter_id type="integer">1</vcenter_id> 
  <created_at type="dateTime">2019-11-11T08:00:51Z</created_at>  
  <updated_at type="dateTime">2019-11-11T08:28:36Z</updated_at>  
  <version>6.4.5 Build 13282012</version>  
  <host>nsx-c.onappdev.lviv</host>  
  <status>RUNNING</status>  
  <uptime>8 days, 16 hours, 33 minutes</uptime>  
</nsx_manager>
```

**Where:**

- **api_url** - the URL used to connect to NSX-V
- **created_at** - the date when the NSX manager was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **updated_at** - the date when the NSX manager was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
- **id** - the ID of the NSX manager
- **label** - the label of the NSX manager
- **login** - login of the NSX manager
- **password** - password of the NSX manager
- **vcenter_id** - ID of the vCenter VS
- **vcenter_type** - Nsx::VCloud::VCenter or Nsx::Hypervisor
- **version** - NSX-V version
**host** - hostname of the vCenter VS

**status** - STARTING, RUNNING, STOPPING, or STOPPED

**uptime** - duration of the uptime

### Page History

**v.6.3 Edge 1**

- removed *last_seen_event* parameter

#### 3.20.7.3 Import NSX Manager

To import an NSX manager, use the following request:

**POST** /settings/nsx/managers/:manager_id/import.xml

**POST** /settings/nsx/managers/:manager_id/import.json

#### XML Request Example

```
```

#### JSON Request Example

```
```

#### 3.20.7.4 Update NSX Manager Credentials

To update the NSX manager’s credentials, use the following request:

**PUT** /settings/nsx/managers/:manager_id/credentials.xml

**PUT** /settings/nsx/managers/:manager_id/credentials.json

#### XML Request Example

```
```

#### JSON Request Example

```
```

**Where:**

- **login** - login for this NSX manager
- **password** - the password for this NSX manager
3.20.8 NSX-V NAT API

NAT (Network Address Translation) service translates source or destination IP addresses and port numbers. Below you can find the list of operations applicable for NSX-V NAT services and rules:

- Get NSX-V NAT Service Details
- Edit NSX-V NAT Service
- Get List of NSX-V NAT Rules
- Get NSX-V NAT Rule Details
- Add NSX-V NAT Rule
- Edit NSX-V NAT Rule
- Delete NSX-V NAT Rule

3.20.8.1 Get NSX-V NAT Service Details

To view the details of a particular NSX-V NAT service, use the following request:

GET /nsx/edges/:edge_id/nat/service.xml
GET /nsx/edges/:edge_id/nat/service.json

**XML Request Example**

```
```

**JSON Request Example**

```
```

**XML Output Example**

```
<nsx_nat_service>
  <id type="integer">3</id>
  <enabled type="boolean">true</enabled>
  <edge_id type="integer">3</edge_id>
  <created_at type="dateTime">2019-11-06T10:16:49Z</created_at>
  <updated_at type="dateTime">2019-11-06T10:16:49Z</updated_at>
  <locked type="boolean">false</locked>
</nsx_nat_service>
```

Where:

- **id** - ID of the NAT service
- **enabled** - true if the NAT service is enabled; otherwise, false
- **edge_id** - the ID of the edge
- **created_at** - the date when the NAT service was created in the [YYYY][MM][DD]T[hh][mm][ss]Z format
- **updated_at** - the date when the NAT service was updated in the [YYYY][MM][DD]T[hh][mm][ss]Z format
3.20.8.2 Edit NSX-V NAT Service

To edit the NSX-V NAT service, use the following request:

PUT /nsx/edges/:edge_id/nat/service.xml
PUT /nsx/edges/:edge_id/nat/service.json

XML Request Example

```bash
curl -i -X PUT -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url http://onapp.test/nsx/edges/3/nat/service.xml -d '<nsx_nat_service><enabled type="boolean">true</enabled><nat_rules type="array"><nat_rule><original_port>1</original_port><translated_port>2</translated_port><protocol>tcp</protocol><enabled type="boolean">true</enabled><logging type="boolean">true</logging><rule_type>user</rule_type><interface type="integer">2</interface><action>dnat</action><original_ip>1.1.1.1</original_ip><translated_ip>2.2.2.2</translated_ip><description>desc</description></nat_rule></nat_rules></nsx_nat_service>
```

JSON Request Example

```bash
curl -i -X PUT -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --url http://onapp.test/nsx/edges/3/nat/service.json -d '{"nsx_nat_service": {"enabled": true,"nat_rules": [{"original_port": "1","translated_port": "2","protocol": "tcp","enabled": true,"logging": true,"rule_type": "user","interface": 2,"action": "dnat","original_ip": "1.1.1.1","translated_ip": "2.2.2.2","description": " desc"}]}}
```

Where:

- enabled - true if the NAT service is enabled; otherwise, false
- nat_rules - an array of the NSX-V NAT rules with the following details:
  - original_port - the port of original IP address
  - translated_port - the port of translated IP address
  - protocol - any, tcp, udp or icpm
  - enabled - true if the rule is enabled; otherwise, false
  - logging - true if logging is enabled; otherwise, false
  - rule_type - user
  - interface - vnic's or sub-interface's index
  - action - DNAT or SNAT
  - original_ip - the original IP address to apply this rule on
  - translated_ip - the IP address to translate the addresses of outgoing packets to
  - description - description of a rule

3.20.8.3 Get List of NSX-V NAT Rules

To get a list of NSX-V NAT rules, use the following request:

GET /nsx/edges/:edge_id/nat/service/rules.xml
GET /nsx/edges/:edge_id/nat/service/rules.json
XML Request Example

JSON Request Example

XML Output Example

<nsx_nat_rules type="array">
  <nsx_nat_rule>
    <id type="integer">23</id>
    <action>dnat</action>
    <enabled type="boolean">true</enabled>
    <interface_id type="integer">9</interface_id>
    <identifier>200723</identifier>
    <logging type="boolean">false</logging>
    <nat_service_id type="integer">3</nat_service_id>
    <original_ip>1.1.1.1</original_ip>
    <translated_ip>1.1.1.1</translated_ip>
    <original_port>any</original_port>
    <translated_port>any</translated_port>
    <protocol>any</protocol>
    <created_at type="dateTime">2019-11-06T12:45:29Z</created_at>
    <updated_at type="dateTime">2019-11-06T12:45:29Z</updated_at>
    <interface_type>Nsx::NetworkInterface</interface_type>
  </nsx_nat_rule>
</nsx_nat_rules>

Where:

- **action** - **DNAT** or **SNAT**
- **created_at** - the date when the NAT rule was created in the [YYYY][MM][DD][hh][mm][ss]Z format
- **description** - description of a rule
- **enabled** - **true** if the rule is enabled; otherwise, **false**
- **icmp_type** - any, address-mask-request, address-mask-reply, destination-unreachable, echo-request, echo-reply, parameter-problem, redirect, router-advertisement, router-solicitation, source-quench, time-exceeded, timestamp-request and timestamp-reply
- **id** - the ID of the edge
- **identifier** - the identifier of the rule
- **logging** - **true** if logging is enabled, otherwise, **false**
- **nat_service_id** - the ID of a NAT service
- **interface_id** - the ID of the network interface
original_ip - the original IP address to apply this rule on
original_port - the port of original IP address
protocol - any, tcp, udp, or icpm
rule_type - user or internal_high
translated_ip - the IP address to translate the addresses of outgoing packets to
translated_port - the port of translated IP address
updated_at - the date when the NAT rule was updated in the [YYYY][MM][DD][T][hh][mm][ss]Z format
interface_type - Nsx::NetworkInterface or Nsx::SubInterface

3.20.8.4 Get NSX-V NAT Rule Details
To get details of a particular NSX-V NAT rule, use the following request:
GET /nsx/edges/edge_id/nat/service/rules/:rule_id.xml
GET /nsx/edges/edge_id/nat/service/rules/:rule_id.json

XML Request Example

```
curl -i -X GET -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --url
```

JSON Request Example

```
curl -i -X GET -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --url
```

XML Output Example

```
<nsx_nat_rule>
  <id type="integer">24</id>
  <action>snat</action>
  <enabled type="boolean">true</enabled>
  <interface_id type="integer">9</interface_id>
  <identifier>200724</identifier>
  <logging type="boolean">false</logging>
  <nat_service_id type="integer">3</nat_service_id>
  <original_ip>1.1.1.1</original_ip>
  <rule_type>user</rule_type>
  <translated_ip>1.1.1.1</translated_ip>
  <original_port>any</original_port>
  <protocol>any</protocol>
  <translated_port>any</translated_port>
  <icmp_type nil="true"/>
  <description nil="true"/>
  <created_at type="dateTime">2019-11-06T12:45:29Z</created_at>
  <updated_at type="dateTime">2019-11-06T12:45:29Z</updated_at>
  <interface_type>Nsx::NetworkInterface</interface_type>
</nsx_nat_rule>
```

Where:

id - the ID of the rule
**action** - DNAT or SNAT

**enabled** - true if the rule is enabled; otherwise, false

**interface_id** - the ID of the network interface

**identifier** - the identifier of the rule

**logging** - true if logging is enabled; otherwise, false

**nat_service_id** - the ID of the NAT service

**original_ip** - the original IP address to apply this rule on

**rule_type** - user or internal_high

**translated_ip** - the IP address to translate the addresses of outgoing packets to

**original_port** - the port of original IP address

**translated_port** - the port of translated IP address

**protocol** - any, tcp, udp, or icmp

**icmp_type** - any, address-mask-request, address-mask-reply, destination-unreachable, echo-request, echo-reply, parameter-problem, redirect, router-advertisement, router-solicitation, source-quench, time-exceeded, timestamp-request and timestamp-reply

**description** - description of the rule

**created_at** - the date when the NAT rule was created in the [YYYY][MM][DD][hh][mm][ss]Z format

**updated_at** - the date when the NAT rule was updated in the [YYYY][MM][DD][hh][mm][ss]Z format

**interface_type** - Nsx::NetworkInterface or Nsx::SubInterface

3.20.8.5 Add NSX-V NAT Rule

To create a new NSX-V NAT rule, use the following request:

```bash
curl -i -X POST -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass -d "<nsx_nat_rule><original_port>1</original_port><translated_port>2</translated_port><protocol>tcp</protocol><enabled type="boolean">true</enabled><logging type="boolean">true</logging><rule_type>user</rule_type><interface type="Integer">2</interface><action>dnat</action><Original_ip>1.1.1.1</Original_ip><translated_ip>2.2.2.2</translated_ip><description>desc</description></nsx_nat_rule>"
```

**XML Request Example**

```bash
curl -i -X POST -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass -d '{"nsx_nat_rule": {"original_port": "1","translated_port": "2","protocol": "tcp","enabled": true,"logging": true,"rule_type": "user","interface": 2,"action": "dnat","original_ip": "1.1.1.1","translated_ip": "2.2.2.2","description": " desc"}}'
```

**JSON Request Example**
Where:

- **original_port** - the port of original IP address
- **translated_port** - the port of translated IP address
- **protocol** - any, tcp, udp or icpm
- **enabled** - true if the rule is enabled; otherwise, false
- **logging** - true if logging is enabled, otherwise, false
- **rule_type** - user
- **interface** - vnic’s or sub-interface’s index
- **action** - DNAT or SNAT
- **original_ip** - the original IP address to apply this rule on
- **translated_ip** - the IP address to translate the addresses of outgoing packets to
- **description** - the description of a NAT rule

### 3.20.8.6 Edit NSX-V NAT Rule

To edit an NSX-V NAT rule, use the following request:

**XML Request Example**

```bash
```

**JSON Request Example**

```bash
```

Where:

- **original_port** - the port of original IP address
- **translated_port** - the port of translated IP address
- **protocol** - any, tcp, udp or icpm
- **enabled** - true if the rule is enabled; otherwise, false
- **logging** - true if logging is enabled, otherwise, false
- **rule_type** - user
- **interface** - the ID of the network interface
- **action** - DNAT or SNAT
3.20.8.7 Delete NSX-V NAT Rule
To delete the NSX-V NAT rule, use the following request:

DELETE /nsx/edges/:edge_id/nat/service/rules/:rule_id.xml
DELETE /nsx/edges/:edge_id/nat/service/rules/:rule_id.json

XML Request Example

```
curl -i -X DELETE -H 'Accept: application/xml' -H 'Content-type: application/xml' -u user:userpass --
```

JSON Request Example

```
curl -i -X DELETE -H 'Accept: application/json' -H 'Content-type: application/json' -u user:userpass --
```

Returns HTTP 204 response on successful deletion, or HTTP 404 when a NAT rule with the ID specified is not found.

3.21 NSX-T Integration API

This section provides the API calls you can use to manage NSX-T items imported from vCloud.

- NSX-T Edge Gateways API
- NSX-T Firewall Rules API
- NSX-T NAT API

3.21.1 NSX-T Edge Gateways API

This section provides the API calls you can use to manage NSX-T edge gateways. Here you can find the following pages:

- Get List of NSX-T Edge Gateways
- Get NSX-T Edge Gateway Details
- Create NSX-T Edge Gateway
- Edit NSX-T Edge Gateway
- Delete NSX-T Edge Gateway

3.21.1.1 Get List of NSX-T Edge Gateways

To view the list of NSX-T edge gateways, use the following request:

GET /nsxt_edge_gateways.xml
GET /nsxt_edge_gateways.json

XML Request Example
curl -i -X GET http://onapp.test/nsxt_edge_gateways.xml -u user:userpass

JSON Request Example

```
curl -i -X GET http://onapp.test/nsxt_edge_gateways.json -u user:userpass
```

XML Output Example

```
<vcloud_nsxt_edge_gateways type="array">
  <vcloud_nsxt_edge_gateway>
    <id type="integer">5</id>
    <identifier>ef0ccf5b-2cfa-4148-a0ee-9e3221c9eace</identifier>
    <label>T1-a1</label>
    <status>REALIZED</status>
    <description>ge changed</description>
    <distributed_routing_enabled type="boolean">true</distributed_routing_enabled>
    <vdc_id type="integer">11</vdc_id>
    <created_at type="dateTime">2021-02-17T00:00+02:00</created_at>
    <updated_at type="dateTime">2021-03-15T17:36:24+02:00</updated_at>
    <firewalls_locked type="boolean">false</firewalls_locked>
  </vcloud_nsxt_edge_gateway>
  <vcloud_nsxt_edge_gateway>
    <id type="integer">20</id>
    <identifier>795c0909-41e7-4e25-a67a-7bba1734a354</identifier>
    <label>RD-NSXT-test-3</label>
    <status>REALIZED</status>
    <description/>
    <distributed_routing_enabled type="boolean">true</distributed_routing_enabled>
    <vdc_id type="integer">29</vdc_id>
    <created_at type="dateTime">2021-02-22T14:05:05+02:00</created_at>
    <updated_at type="dateTime">2021-02-22T14:05:05+02:00</updated_at>
    <firewalls_locked type="boolean">false</firewalls_locked>
  </vcloud_nsxt_edge_gateway>
</vcloud_nsxt_edge_gateways>
```

Where:

- **vcloud_nsxt_edge_gateways** - array of NSX-T edge gateways
- **vcloud_nsxt_edge_gateway** - an array of parameters related to the NSX edge:
  - **id** - ID of the NSX-T edge gateway
  - **identifier** - identifier of NSX-T edge gateway
  - **label** - the name of the edge gateway
  - **status** - edge gateway status
  - **description** - the description of the edge gateway
  - **distributed_routing_enabled** - true if distributed routing is enabled, otherwise false
  - **vdc_id** - ID of the VDC the edge gateway is associated with
  - **created_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
  - **updated_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format
  - **firewalls_locked** - true if transaction UpdateNsxtFirewallRulesOfEdgeGateway is in progress, otherwise false
3.21.1.2 Get NSX-T Edge Gateway Details
To view the details of an edge gateway, use the following request:

GET /nsxt_edge_gateways/:id.xml
GET /nsxt_edge_gateways/:id.json

XML Request example

```
curl -i -X GET http://onapp.test/nsxt_edge_gateways/22.xml
-u user:userpass
```

JSON Request Example

```
curl -i -X GET http://onapp.test/nsxt_edge_gateways/22.json
-u user:userpass
```

XML Output Example

```
<vcloud_nsxt_edge_gateway>
    <id type="integer">7</id>
    <identifier>8CCD754C-90EC-BA80-F46D-D06A9874029B</identifier>
    <label>plak4yrj35b0tdk9k514vgf5z3wn7rtzj5</label>
    <status nil="true/>
    <description>Aut maxime eius officiis dolores sed modi nobis impedit.</description>
    <distributed_routing_enabled type="boolean">false</distributed_routing_enabled>
    <vdc id type="integer">13</vdc_id>
    <created at type="dateTime">2021-09-14T13:55:45Z</created_at>
    <updated at type="dateTime">2021-09-14T13:55:45Z</updated_at>
    <firewalls_locked type="boolean">false</firewalls_locked>
    <ip_settings>
        <external_network_id type="integer">7</external_network_id>
        <ip_nets type="array">
            <ip_net>
                <ip_net_configuration_id type="integer">7</ip_net_configuration_id>
                <ip_address nil="true"/>
                <ip_net>10.0.23.0/24</ip_net>
                <sub_allocated_ip_ranges type="array">
                    <sub_allocated_ip_range>
                        <start_address>192.168.1.1</start_address>
                        <end_address>192.168.1.10</end_address>
                    </sub_allocated_ip_range>
                </sub_allocated_ip_ranges>
            </ip_net>
        </ip_nets>
    </ip_settings>
</vcloud_nsxt_edge_gateway>
```

Where:

- **id** - ID of NSX-T edge gateway
- **identifier** - identifier of NSX-T edge gateway
- **label** - the name of NSX-T edge gateway
- **status** - NSX-T edge gateway status
- **description** - additional info about the edge gateway if any
**distributed_routing_enabled** - true if distributed routing is enabled for the edge gateway, otherwise false

**vdc_id** - ID of the vDC the edge gateway is associated with

**created_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

**updated_at** - the date in the [YYYY][MM][DD][T][hh][mm][ss]Z format

**firewalls_locked** - true if transaction UpdateNsxtFirewallRulesOfEdgeGateway is in progress; otherwise false

**ip_settings** - the array of parameters that relates to IP settings

  - **external_network_id** - ID of the external network to which the edge gateway is connected
  - **ip_nets** - the array of parameters that relate to IP nets
    - **ip_net_configuration_id** - ID of IP net configuration
    - **ip_address** - external address, it is shown if ID address is enabled by default and used, otherwise true
    - **sub_allocated_ip_ranges** - the array that relates to sub-allocated IP ranges of the external network to the edge gateway
      - **start_address** - start address of sub-allocated IP range
      - **end_address** - end address of sub-allocated IP range

**Page History**

v. 6.6 Edge 4

Added the following arrays and parameters: **ip_settings**, **external_network_id**, **ip_nets**, **ip_net_configuration_id**, **ip_address**, **ip_net**, **sub_allocated_ip_ranges**, **start_address**, **end_address**.

### 3.21.1.3 Create NSX-T Edge Gateway

To create an NSX-T edge gateway, use the following request:

**XML Request Example**

```bash
curl -i -X PUT -u user:userpass --url http://onapp.test/nsxt_edge_gateways/wizard/summary.xml -H 'Accept: application/xml' -H 'Content-type: application/xml' -d '<<vcloud_nsxt_edge_gateway><label>$nsx-t label$</label><description></description><distributed_routing_enabled>true</distributed_routing_enabled><organization_id>$org_id$</organization_id><vdc_id>$vdc_id$</vdc_id><external_network_id>$external_network_id$</external_network_id><primary_ip>$primary_ip$</primary_ip><ip_ranges type="array"><element><start_address>$start_address$</start_address><end_address>$end_address$</end_address></element><element><start_address>$start_address$</start_address><end_address>$end_address$</end_address></element></ip_ranges>>vcloud_nsxt_edge_gateway>>'
```

**JSON Request Example**

```bash
PUT /nsxt_edge_gateways/wizard/summary.json
```

Put /nsxt_edge_gateways/wizard/summary.xml
To edit an edge gateway, use the following request:

**JSON Request Example**

```bash
curl -i -X PATCH -u user:userpass --url http://onapp.test/nsxt_edge_gateways/:id.json -H 'Accept: application/json' -H 'Content-type: application/json' -d '{"vcloud_nsxt_edge_gateway": {"label": "example.label", "description": "example.description"}}'
```

Where:

- **label** - the name of the edge gateway
- **description** - the description of the edge gateway
3.21.1.5 Delete NSX-T Edge Gateway
To delete an edge gateway, use the following request:

DELETE /nsxt_edge_gateways/:id.xml
DELETE /nsxt_edge_gateways/:id.json

XML Request Example

curl -i -X DELETE http://onapp.test/nsxt_edge_gateways/:id.xml
   -u user:userpass

JSON Request Example

curl -i -X DELETE http://onapp.test/nsxt_edge_gateways/:id.json
   -u user:userpass

3.21.2 NSX-T Firewall Rules API
This section contains the API requests you can use to manage NSX-T firewall rules:

- View Firewall Rules for NSX-T Edge Gateway
- Create NSX-T Firewall Rule
- Delete NSX-T Firewall Rule
- Edit NSX-T Firewall Rule

3.21.2.1 View Firewall Rules for NSX-T Edge Gateway
To get a list of NSX-T firewall rules assigned to the NSX-T edge gateway, use the following request:

GET /nsxt_edge_gateways/:id/nsxt_firewall_rules.xml
GET /nsxt_edge_gateways/:id/nsxt_firewall_rules.json

XML Request Example

curl -i -X GET
http://onapp.test/nsxt_edge_gateways/26/nsxt_firewall_rules.json
   -u user:userpass -H 'Accept: application/json' -H 'Content-Type:
   application/json'

JSON Request Example

curl -i -X GET
http://onapp.test/nsxt_edge_gateways/26/nsxt_firewall_rules.xml
   -u user:userpass -H 'Accept: application/xml' -H 'Content-Type:
   application/xml'

XML Output Example
```xml
<vcloud_nsxt_firewall_rules type="array">
    <vcloud_nsxt_firewall_rule>

        <version type="integer">6</version>
    </vcloud_nsxt_firewall_rule>
</vcloud_nsxt_firewall_rules>
```

**Where:**

- `vcloud_nsxt_firewall_rules` - an array of firewalls rules assigned to NSX-T edge gateway
- `id` - ID of firewall rule
- `identifier` - identifier of firewall rule, which is using to synchronize the firewall rules between vCloud and OnApp
label - name of a firewall rule
status - parameter imported from VCD side, is always nil
description - parameter imported from VCD side, is always nil
direction - direction of traffic from the point of view of the destination object. It can be IN, OUT, and IN_OUT, the default value is IN_OUT. IN means that only traffic to the object is checked, OUT means that only traffic from the object is checked, and IN_OUT means traffic in both directions is checked
ip_protocol - Internet Protocol version, only IPv4 is supported
rule_type - type of firewall rule in OnApp. It can be only user_defined, created on the OnApp side.
enabled - true, if the service is enabled; otherwise, false
logging - true, if logging is enabled for this rule; otherwise, false
vcloud_nsxt_edge_gateway_id - ID of NSX-T edge gateway
created_at - the date when the firewall service was created in the [YYYY][MM][DD][hh][mm][ss]Z format
updated_at - the date when the firewall service was updated in the [YYYY][MM][DD][hh][mm][ss]Z format
version - version of a firewall rule. It is 0 when a rule is just created, 1 if it was edited once, 2 if it was edited twice, and so on

3.21.2.2 Create NSX-T Firewall Rule
To create a firewall rule for NSX-T edge gateway, use the following request:

PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.xml
PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.json

XML Request Example

curl -s -i -X PUT
http://onapp.test/nsxt_edge_gateways/17/nsxt_firewall_rules.xml -u
curl -s -i -X PUT

JSON Request Example

curl -s -i -X PUT
http://onapp.test/nsxt_edge_gateways/17/nsxt_firewall_rules.json -u

Where:
nsxt_firewall_rules - an array of firewall rules assigned to an NSX-T edge gateway
label - the name of the NSX-T firewall rule
direction - the direction of traffic from the point of view of the destination object. Can IN, OUT, and IN/OUT; IN means that only traffic to the object is checked, OUT means that only traffic
from the object is checked, and IN/OUT means traffic in both directions is checked. The default is IN/OUT

logging - true if logging is enabled for the rule; otherwise false

action - action applied by the rule; can be ALLOW or DROP. The default is ALLOW

3.21.2.3 Delete NSX-T Firewall Rule

3.21.2.3.1 Delete NSX-T Firewall Rule
To delete a particular firewall rule assigned to an NSX-T edge gateway, use the following request:

PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.xml
PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.json

JSON Request Example

curl -s -i -X PUT
http://onapp.test/nsxt_edge_gateways/17/nsxt_firewall_rules.json -u
user:userpass -H 'Accept: application/json' -H 'Content-type:
application/json' -d
"{"nsxt_firewall_rules": [{"id":34,"label":"label32","action":"DROP","logging":"true", "identifier":"ee6c52db-0106-4d22-9881-b7eb788f72","sources": [{"type":"ip_set","identifier":"b26fae09-b13f-16cbff5dc467"}]}]}"

XML Request Example

curl -s -i -X PUT
http://onapp.test/nsxt_edge_gateways/17/nsxt_firewall_rules.xml -u
user:userpass -H 'Accept: application/xml' -H 'Content-type:
application/xml' -d '<?xml version="1.0" encoding="UTF-8"?>
<nsxt_firewall_rules type="array"> <nsxt_firewall_rule>
<label>label3</label> <identifier>4ed62bf3-dd22-44ec-90f1-1780ccc4f6e</identifier> <direction>IN</direction>
<logging>true</logging> <action>DROP</action>
</nsxt_firewall_rule>
</nsxt_firewall_rules>'

Where:

nsxt_firewall_rules - an array of firewall rules assigned to NSX-T edge gateway

label - the name of NSX-T firewall rule

identifier - identifier of NSX-T firewall rule

direction - the direction of traffic from the point of view of the destination object. Can IN, OUT, and IN/OUT; IN means that only traffic to the object is checked, OUT means that only traffic from the object is checked, and IN/OUT means traffic in both directions is checked. The default is IN/OUT

logging - true if logging is enabled for the rule; otherwise false

action - action applied by the rule; can be ALLOW or DROP. The default is ALLOW

3.21.2.3.2 Delete All NSX-T Firewall Rules
To delete all firewall rules assigned to a particular NSX-T edge gateway, use the following request:

PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.xml
PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.json

JSON Request Example
OnApp 6.6 Edge 4 and VMware Cloud Director Configuration Guide

```bash
curl -s -i -X PUT
http://onapp.test/nsxt_edge_gateways/17/nsxt_firewall_rules.json -u
user:userpass -H 'Accept: application/json' -H 'Content-type:
application/json' -d '{"nsxt_firewall_rules":[]}'
```

**XML Request Example**

```bash
curl -s -i -X PUT
http://onapp.test/nsxt_edge_gateways/17/nsxt_firewall_rules.xml -u
user:userpass -H 'Accept: application/xml' -H 'Content-type:
application/xml' -d '<?xml version="1.0" encoding="UTF-8"?>
<nsxt_firewall_rules type="array"> <nsxt_firewall_rule>
<label>label</label>
<direction>IN</direction>
<logging>true</logging>
?action>DROP</action>
<sources type="array">
<source type="ip_set">
<identifier>9BC5E5CD-DB19-114F-11AE-F6511649581C</identifier>
</source>
</sources>
<destinations type="array">
<destination type="security_group">
<identifier>9958CBF9-D3BA-24D2-B62D-3A322371E190</identifier>
</destination>
</destinations>
<applications type="array">
,application>
<identifier>5235603B-6DC9-6E77-C584-B2F209C5A647</identifier>
</application>
</applications>
</nsxt_firewall_rule>
</nsxt_firewall_rules>
```

3.21.2.4 Edit NSX-T Firewall Rule

To edit an NSX firewall rule, use the following request:

PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.xml
PUT /nsxt_edge_gateways/:id/nsxt_firewall_rules.json

**XML Request Example**

```bash
curl "http://onapp.test/nsxt_edge_gateways/13/nsxt_firewall_rules.xml" -d
'<?xml version="1.0" encoding="UTF-8"?>
<nsxt_firewall_rules type="array">
<nsxt_firewall_rule>
<label>label</label>
<direction>IN</direction>
<logging>true</logging>
?action>DROP</action>
<sources type="array">
<source type="ip_set">
<identifier>9BC5E5CD-DB19-114F-11AE-F6511649581C</identifier>
</source>
</sources>
<destinations type="array">
<destination type="security_group">
<identifier>9958CBF9-D3BA-24D2-B62D-3A322371E190</identifier>
</destination>
</destinations>
<applications type="array">
,application>
<identifier>5235603B-6DC9-6E77-C584-B2F209C5A647</identifier>
</application>
</applications>
</nsxt_firewall_rule>
</nsxt_firewall_rules>
```

**JSON Request Example**

```bash
' -X PUT \
-u user:userpass \
-H "Accept: application/xml" \
-H "Content-Type: application/xml"
```
curl "http://onapp.test/nsxt_edge_gateways/1/nsxt_firewall_rules.json" -d "{"nsxt_firewall_rules": [{"label": "label", "direction": "IN", "logging": "true", "action": "DROP", "sources": [{"type": "ip_set", "identifier": "C0B753BB-C3E4-32C4-3296-26E583604A3C"}], "destinations": [{"type": "security_group", "identifier": "2B256CED-048C-6865-EE90-71666B580AA4"}], "applications": [{"identifier": "1EB7C45C-55B6-DA7F-E26B-75F8AF93218C"}]}, ...]"

You will get a 204 status response on success, and 404 if there is no such NSX-T edge gateway with a requested ID or you entered an incorrect URL.

Where:

- **nsxt_firewall_rules** - an array of firewall rules assigned to an NSX-T edge gateway
- **label** - the label of the firewall rule
- **direction** - the direction of traffic from the point of view of the destination object. Can IN, OUT, and IN/OUT; IN means that only traffic to the object is checked, OUT means that only traffic from the object is checked, and IN/OUT means traffic in both directions is checked. The default is IN/OUT
- **logging** - true, if logging is enabled for this rule; otherwise, false
- **action** - accept or deny
- **sources** - an array of IP sets and security groups
  - **type** - type of source, can be either ip_set or security_group
  - **identifier** - identifier of a source
- **destinations** - an array of destinations for the rule
  - **type** - type of a destination, can be either security_group or ip_set
  - **identifier** - identifier of a destination
- **applications** - an array of application port profiles used for the rule
  - **identifier** - identifier of an application port profile

### 3.21.3 NSX-T NAT API

This section contains the API requests you can use to manage NSX-T NAT rules:

- [Get List of NSX-T NAT Rules](#)
- [Add NSX-T NAT Rule](#)
- [Delete NSX-T NAT Rule](#)

#### 3.21.3.1 Get List of NSX-T NAT Rules

To get a list of NSX-T NAT rules, use the following request:

**GET** /nsxt_edge_gateways/:id/nat_rules.xml
**GET** /nsxt_edge_gateways/:id/nat_rules.json

**XML Request Example**

### JSON Request Example

```
```

### XML Output Example

```
<vcloud_nsxt_nat_rules type="array">
  <vcloud_nsxt_nat_rule>
    <id type="integer">38</id>
    <identifier>177d3ab4-48bc-4a91-8506-f86be37c616e</identifier>
    <label>ms NO DNAT loggin</label>
    <description>some desc</description>
    <enabled type="boolean">true</enabled>
    <rule_type>NO_DNAT</rule_type>
    <vcloud_nsxt_edge_gateway_id type="integer">18</vcloud_nsxt_edge_gateway_id>
    <port nil="true"/>
    <logging type="boolean">true</logging>
    <system type="boolean">false</system>
    <version type="integer">0</version>
    <created_at type="dateTime">2021-04-06T13:50:35Z</created_at>
    <updated_at type="dateTime">2021-04-06T13:50:35Z</updated_at>
  </vcloud_nsxt_nat_rule>
  <vcloud_nsxt_nat_rule>
    <id type="integer">39</id>
    <identifier>937ddf09-cae8-4449-bc55-d8f435e6a683</identifier>
    <label>ms NO SNAT</label>
    <description>some description</description>
    <enabled type="boolean">true</enabled>
    <rule_type>NO_SNAT</rule_type>
    <vcloud_nsxt_edge_gateway_id type="integer">18</vcloud_nsxt_edge_gateway_id>
    <port nil="true"/>
    <logging type="boolean">true</logging>
    <system type="boolean">false</system>
    <version type="integer">0</version>
    <created_at type="dateTime">2021-04-06T13:50:35Z</created_at>
    <updated_at type="dateTime">2021-04-06T13:50:35Z</updated_at>
  </vcloud_nsxt_nat_rule>
</vcloud_nsxt_nat_rules>
```

Where:

- `vcloud_nsxt_nat_rules` - an array of the NSX-T NAT rules with the following details:
  - `id` - ID of the NAT rule
  - `identifier` - identifier of the NAT rule
  - `description` - description of the NAT rule
  - `enabled` - true if the NAT service is enabled; otherwise, false
  - `rule_type` - source NAT (SNAT) or destination NAT (DNAT), NO_DNAT (prevents the translation of the external IP address of packets received by an organization VDC from an external network or from another organization VDC network), and NO_SNAT (prevents the translation of the internal IP address of packets sent from an organization VDC out to an external network or to another organization VDC network)
  - `vcloud_nsxt_edge_gateway_id` - the ID of NSX-T edge
3.21.3.2 Add NSX-T NAT Rule

To create a new NSX-T NAT rule, use the following request:

POST /nsxt_edge_gateways/:nsxt_edge_gateway_id/nat_rules.xml

XML Request Example for DNAT Rule

```xml
<?xml version="1.0" encoding="UTF-8"?>
<nsxt:nat-rule>
  <description>description here</description>
  <enabled>1</enabled>
  <label>ms regular DNAT rule API call</label>
  <logging>1</logging>
  <port>80</port>
  <rule_type>DNAT</rule_type>
  <vcloud_nsxt_application_port_profile_id>128591</vcloud_nsxt_application_port_profile_id>
  <vcloud_nsxt_destination_ip_address />
  <vcloud_nsxt_external_ip_address>192.168.1.45</vcloud_nsxt_external_ip_address />
  <vcloud_nsxt_internal_ip_address>192.168.1.46</vcloud_nsxt_internal_ip_address />
</nsxt:nat-rule>
```

JSON Request Example for DNAT Rule

```json
curl -L -X POST "http://onapp.test/nsxt_edge_gateways/26/nat_rules.json" -H 'Accept: application/json' -H 'Content-Type: application/json' -u 'user:userpass' -d '{"nsxt_nat_rule": {"label": "ms regular DNAT rule", "description": "description here", "vcloud_nsxt_application_port_profile_id": "128591", "enabled": "1", "rule_type": "DNAT", "vcloud_nsxt_external_ip_address": "192.168.1.45", "vcloud_nsxt_internal_ip_address": "192.168.1.46", "vcloud_nsxt_destination_ip_address": "," , "port": "80", "logging": "1"}}'
```

XML Request Example for NO DNAT Rule

```xml
<nsxt:nat-rule>
</nsxt:nat-rule>
```
<nsxt-nat-rule>
   <description>description here</description>
   <enabled>true</enabled>
   <label>ms NO DNAT all fields API CALL</label>
   <logging>true</logging>
   <port>443</port>
   <rule_type>NO_DNAT</rule_type>
   <vcloud_nsxt_application_port_profile_id />
   <vcloud_nsxt_destination_ip_address />
   <vcloud_nsxt_external_ip_address>192.168.1.45</vcloud_nsxt_external_ip_address>
   <vcloud_nsxt_internal_ip_address />
</nsxt-nat-rule>''

JSON Request Example for NO DNAT Rule

curl -i -X POST "http://onapp.test/nsxt_edge_gateways/26/nat_rules.json" -H 'Accept: application/json' -H 'Content-Type: application/json' -u 'user:userpass' -d '{"nsxt_nat_rule": {"label": "ms NO DNAT from API", "description": "some description", "vcloud_nsxt_application_port_profile_id": ", "enabled": "1", "rule_type": "NO_DNAT", "vcloud_nsxt_external_ip_address": "192.168.1.45", "vcloud_nsxt_destination_ip_address": ", "vcloud_nsxt_internal_ip_address": ", "port": "443", "logging": "1"}, "nsxt_edge_gateway_id": "26"}''

XML Request Example for SNAT Rule

<nsxt-nat-rule>
   <description>description here</description>
   <enabled>true</enabled>
   <label>ms SNAT all fields API CALL</label>
   <logging>true</logging>
   <port />
   <rule_type>SNAT</rule_type>
   <vcloud_nsxt_application_port_profile_id />
   <vcloud_nsxt_destination_ip_address>192.168.1.59</vcloud_nsxt_destination_ip_address>
   <vcloud_nsxt_external_ip_address>192.168.1.45</vcloud_nsxt_external_ip_address>
   <vcloud_nsxt_internal_ip_address>192.168.1.46</vcloud_nsxt_internal_ip_address>
</nsxt-nat-rule>''

JSON Request Example for SNAT Rule

curl -i -X POST "http://onapp.test/nsxt_edge_gateways/26/nat_rules.json" -H 'Accept: application/json' -H 'Content-Type: application/json' -u 'user:userpass' -d '{"nsxt_nat_rule": {"label": "ms SNAT all fields from API", "description": "some description", "vcloud_nsxt_application_port_profile_id": "", "enabled": "1", "rule_type": "SNAT", "vcloud_nsxt_destination_ip_address": "192.168.1.59", "vcloud_nsxt_external_ip_address": "192.168.1.45", "vcloud_nsxt_internal_ip_address": "192.168.1.46"}, "nsxt_edge_gateway_id": "26"}''
XML Request Example for NO SNAT Rule

```bash
<nsxt-nat-rule>
    <description>description here</description>
    <enabled>1</enabled>
    <label>ms NO SNAT all fields API call</label>
    <logging></logging>
    <port/>
    <rule_type>NO_SNAT</rule_type>
    <vcloud_nsxt_application_port_profile_id/>
    <vcloud_nsxt_destination_ip_address>192.168.1.45</vcloud_nsxt_destination_ip_address>
    <vcloud_nsxt_external_ip_address/>
    <vcloud_nsxt_internal_ip_address>192.168.1.33/32</vcloud_nsxt_internal_ip_address>
</nsxt-nat-rule>
```

JSON Request Example for NO SNAT Rule

```bash
curl -i -X POST "http://onapp.test/nsxt_edge_gateways/26/nat_rules.json" -H 'Accept: application/json' -H 'Content-Type: application/json' -u 'user:userpass' -d '{"nsxt_nat_rule": {"label": "ms NO SNAT ALL fields via API", "description": "some description", "vcloud_nsxt_application_port_profile_id": ",", "enabled": "1", "rule_type": "NO_SNAT", "vcloud_nsxt_external_ip_address": "", "vcloud_nsxt_internal_ip_address": "192.168.1.33/32", "vcloud_nsxt_destination_ip_address": "192.168.1.59", "port": ",", "logging": "1"}, "nsxt_edge_gateway_id": "26"}'}
```

Returns HTTP/1.1 201 Created response on successful creation.

**Where:**

- **description** - the description of a NAT rule
- **enabled** - 1 if NAT rule is enabled, otherwise 0
- **label** - name of a rule
- **logging** - 1 if the address translation performed by this rule will be logged after rule creation, otherwise 0
- **port** - applicable only for DNAT / NO DNAT rules; port of packets received by an organization
VDC network that is coming from an external network or another organization VDC network to be translated by DNAT rule

_rule_type_ - the type of rule

_vcloud_nsxt_application_port_profile_id_ - applicable only for DNAT rule, specific application port profile to which to apply a rule. The application port profile includes a port and a protocol that the incoming traffic uses on the NSX-T edge gateway to connect to the internal network

_vcloud_nsxt_destination_ip_address_ - applicable only for SNAT / NO SNAT; if a rule applies only for traffic to a specific domain, an IP address for this domain, or an IP address range in CIDR format. If not specified, the SNAT rule applies to all destinations outside of the local subnet.

_vcloud_nsxt_external_ip_address_ - the public IP address of the NSX-T edge gateway for which you are configuring a rule. The IP addresses that you enter must belong to the sub-allocated IP range of the edge gateway; can be only IPv4 or CIDR.

_vcloud_nsxt_internal_ip_address_ - if you are creating a DNAT rule, it is the IP address or a range of IP addresses of the virtual server for which you are configuring DNAT so that they can receive traffic from the external network.

If you are creating SNAT/ NO SNAT rule, it is the IP address or a range of IP addresses of the virtual servers for which you are configuring the rule so that they can send traffic to the external network. Can be only IPv4 or CIDR.

3.21.3.3 Delete NSX-T NAT Rule

To delete an NSX-T NAT rule, use the following request:

DELETE /nsxt_edge_gateways/:id/nat_rules_batch_destroy.xml
DELETE /nsxt_edge_gateways/:id/nat_rules_batch_destroy.json

XML Request Example

curl -i -X DELETE
"http://onapp.test/nsxt_edge_gateways/29/nat_rules_batch_destroy.xml" -H
'Content-Type: application/xml' -u 'user:userpass' -d
'<?xml version="1.0" encoding="UTF-8"?>
<nsxt_nat_rules_identifiers type="array">
    <nsxt_nat_rules_identifier>194eb8f33-c584-492e-a279-a1cea58fa6f</nsxt_nat_rules_identifier></nsxt_nat_rules_identifiers>"

JSON Request Example

curl -i -X DELETE
"http://onapp.test/nsxt_edge_gateways/29/nat_rules_batch_destroy.json" -H
'Content-Type: application/json' -u 'user:userpass' -d
'{"nsxt_nat_rules_identifiers": ["ad403c90-bc49-473e-8253-471819ec56b5"],
"nsxt_edge_gateway_id": "29"}"

Returns HTTP/1.1 200 OK response on successful deletion.
